I did that a couple months ago on my Falcon. I love it!

The only obvious thing I can think of is to check your NVDI "Drivers" CPX and make sure it's activated and set up for your printer. Are you still using the control panel CPX or COPS? (I find COPS to be much better all around).

> BTW, I'm using Thing 1.27 as my desktop now - sheer brilliance!
>I've sent in my registration.....

I've gotta try that soon too, although MAGXDESK looks good after using some other icons and background pics from the Thing, Gemeni and Jinni demos. And, is 1.27 an English verison? As far as I know, 1.09 is the latest English release. Do you speak German? :^)

Yeah, coming out Real Soon Now.......... <uh huh...>

Sorry, I'm feeling a bit jaded. I've been waiting MONTHS for Titan to get more Nemesis boards in so they can ship it to their (new) North American distributor, ATY Computer, so Alex there can install one in MY Falcon. I haven't visited Titan's web pages in a while, so I haven't seen that new 040 board, but I'll take a look.

Example Titan promotion: "Coming soon within the next two weeks, err, months, or ahh, sometime before the year 2000, or maybe kind of a little after that perhaps, or not! The new 040 board.... oh wait, maybe we should do something faster, or... OH! by the way, this new board has created a bit of a delay with getting our already overdue Nemesis boards out there. But they should ship any day now! <wink wink> <teeeheeeheee!>"

(sorry, slipped into jaded / tired of waiting mode again!)

Keep up the good work Titan! ;^)

Are you aware that you sometimes come across as a bit of a jerk in your replies? (Not that I'm a new Atari user by any means, but it's replies that this that prevent newbies from asking questions - fear of public chastising).

My primary area of Atari expertise is with MIDI/music, not HTML or the web or it's intricacies.

I did read OVLNEW.TXT when I first downlaoded the beta, but I guess I didn't remember that little blurb in there - probably becasue it doesn't really mean anything to me, not eating living and breathing HTML like some people.

Here's what it says:

>1.3011 beta
> - initial implementatin of manual redirection(ala HTTP 1.1)
> You will now be propted <sic> on a post redirection to get/repost/cancel
> Get generally works. If that doesn't try repost. There are still
> some sites that are haveing problems.

Fine. I should have retained the fact that there would be a dialog box popping up and asking me to make a choice. But, as far as WHY it's doing it, and what it's "fixing" or doing, I have no idea!? I never knew this was a problem, and I've been using CAB since the early days with STiK. That is why I was asking here. Perhaps a little explanation for those of us who aren't HTML experts.

|contain the original.

Absolutely right. The Install program allowed me to opt for all
files to be set to read/write. Many thanks indeed for the tip.

I've heard of GEMjing and GEMview, but don't know anything about them. NVDI is commercial and about $75 US, if I remember correctly. Try a full service Atari dealer. As for graphics cards, they DID exist, but I haven't seen any around for quite a while. Maybe used?

I'm not a user of AtariWorks or an HP DeskJet, but I do remember reading
(in several places, including here) that there are problems with AtariWorks
and NVDI4 in combination. IIRC this is due to AtariWorks relying on a bug
in SpeedoGDOS which is fixed in NVDI4. This *may* be your problem, though I
think it usually manifests as printing entirely black pages. Might pay to
try a search with DejaNews for more detailed info about the problem.

Brian,

Re: Your problems with CAF.

I've have not run into the problem you are having but also I tend to work with Midi first (hold the Alt key down while CAF loads and only the midi part of CAF loads). Then work to ADAT tape with some audio work with CAF as a scratch pad.

Do check out SoundPools web site as there is a new Auto folder program for CAF users and the Multi channel audio interfaces available, its called Matrix I believe. Don't know if this will help but its worth a try.

Regards,

Rich

I believe it's just giving you a choice now, whereas before it always
went with "Get" which didn't always work. Most of the time it works,
but sometimes you need one of the other options.

5771. A 'Banner' thought

Newsgroup: comp.sys.atari.st
Date: 1998-09-11 00:00:00 UTC
From: tross3@hamtel.tds.net
Message-ID: <6tc7br$9ut@news2.tds.net>
Source record: 94010

Hi,

I have access to a KIP 2900. This machine is basically a scanner
and laser printer for printing blueprints. The interesting thing is
that it uses rolls of paper, so effectively, the only limit to the
length of a printout is the length of a roll. This system will
enlarge up to 400%, with exceptionally high quality.
This enlargement factor would put a standard US Letter (8.5"x11")
out at 34"x44" (2.85' x 3.66'). Consider a banner consisting of 8
sheets taped end-to-end. 34" x 352" (2.8' x 29.33') - actually a
little shorter if using individual sheets instead of banner paper, due
to cutting and pasting. I'll let you convert this to metric as I'm
just putting forth the idea at the moment, and will put a page up with
full details if there is any interest in the idea I'm about to
present.
I was working with the KIP 2900 today and started thinking.
Wouldn't it be an interesting project to do an Atari banner up - With
a Fuji & something along the lines of foot-and-a-half high letters
proclaiming "The Fuji Lives!" (or a phrase to be decided upon later)
in english, and then translations into French, Spanish, Italian,
German and other appropriate languages running in a smaller size
underneath. It would then be covered front and back with lightweight,
flexible vinyl (the iron-on type is very effective.
This banner could then be mailed to whoever was interested and
willing to:
1. photograph it being displayed in their city
2. Arrange with local Atari users to sign it
3. Send the photographs back, along with a short essay about their
city or involvement in the project.
The photographs would be put up on the web, for everyone to view
and download. Eventually, we might even be able to put out a coffee
table book describing its journey.
Hopefully, we could get some corporate/organizational/individual
sponsorship in exchange for tastefully sized logos on the banner -
this would be to defray the cost of postage and things of that nature.
Anyway, just a thought. Anyone have any thoughts or comments?

Hi there,
Sad as it may be - but regardless of any rumors you've heard - Steinberg have clearly declared that there won't be ANY new Atari versions of Cubase. There won't come any new versions that are adapted to the new clones and there won't be any new functions. They've said that if they can find time for it, there MAY be some bug fixes, but nothing else and not even bug fixes are guaranteed to come. It has VERY low priority for Steinberg now that the PC-market is virtually exploding and VST is becoming ever so popular. Like any other company, they have to make things that can be sold in enough copies to be profitable and the Atari market has unfortunately become too small for that...

However, we're not completely out of support for our beloved platform since SoundPool will develop many of their programs for the faster clones too :)

Best regards,
Claes

Yo MG,

Well, you got my 2 pennies <g>. I'm out of my league here. So I'm not sure
if it's possible. I don't even know if RAP works with MiNT or MintTOS. I
must say that streaming video on my G3 ain't much. It's a big file and
not much video. Live audio (streaming) does work well.

If I could get it to work as well on my Nemesis/Falcon, that would be a
plus.

Yes, that was Titan's first commercial product, a nice jobbie and still
compatible with most everything that wasn't bound to the standard screen
size - although you could configure it to display screen memory from the ST
if you really wanted to squint! (g)

Anyone tried this (from Christian Felsch's home page)?

PDF support seems better than the 3.53 commonly available but for some
reason it wouldn't read any more than the first 10 pages or so of a document
that is about 300 pages long - not because of memory limitations but
possibly because of the document structure (subdivision).

The document is the manual for this new laser printer I've bought! :-)

As far as palmtop PCs go, as long as they are DOS compatible and have a
serial or parallel port then it's the same as with any PC: ghostlink,
parcp, paralink, Zmodem...

There is a page somewhere that deals with connecting the Atari to a
PalmPilot or to Psion S3. Do web search on that.

Cheers,
Nick

Falcons don't use SIMM memory, unless you have a RAM upgrade board. In
that case, it's better to check with the manufacturer of the board, or
tell us what type of board you have.

> many bugs! One wishes that this would be what was being considered.

Yes, there are rumours about Steinberg working on a Milan version, but
I'm not sure how true they are.

Apparently Steinberg's founder (can't remember his name, Eddy
Steinberg?) is working on making a final release of Cubase Audio in his
spare time. Whether this will be a Falcon bug fix only version or a
cross platform one is beyond anyone's knowledge. Milan Computer seem to
be lobbying to get a Milan compatible Cubase, but the Milan still has no
audio hardware at the moment.

For the moment, these are only rumours, so I wouldn't bet my life on
them.

Are you still using the old Atari mouse? If so get a better mouse
with a higher resolution. Someone recently posted here about making
an adapter to use regular PC type mice with the ST through the mouse
port. You ca also connect a serial mouse through the serial port,
you'll need to find the driver.

5786. CAB - Strange Message?

Newsgroup: comp.sys.atari.st
Date: 1998-09-11 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6talqn$259@enews1.newsguy.com>
Source record: 94056

A strange (to me anyway) dialog box has been popping up in CAB lately that I've never seen before.

BTW: I'm using CAB 2.5 with the Beta OVL 1.3011 (under MagiC 5.11).

At seemingly random moments while clicking my way around various web pages, I get the following dialog box:

"Post got redirected!"

"Get this" "Re-post" "Cancel"

(With "Get this" the default selection)

Hitting RETURN or clicking continues with whatever CAB was doing, but the box often reappears shortly after.

What's going on here? I'm not posting anything (ie. not trying to send any e-mail), just browsing. At first I thought perhaps the site I was on had moved some of it's pages elsewhere, but after experimenting a bit, this doesn't seem to be the case.

Is this something attributable to the beta OVL? If so, what purpose does it serve? More importantly, how do I make it stop? ;^\

>

Rubber as everything else is exposed to ageing, and 10-15 years is a
long time for a computer device. I have belt problems regularily with
record, tape and video players, but up to now no problems with disk
drives.
If you pull the belt and it doesn't easily return to it's original
position, it has lost it's elasticity.
You should still consider to purchase a double sided drive, if you find
one.

Cheers,
Wolfgang

I don't use CAB 2.5 (hey, I *will* order it sometime!), but this sounds very
like the behaviour which started puzzling lynx users a year or so ago:
<URL:http://www.crl.com/~subir/lynx/why.html>.

The site in question is doing something questionable in HTTP terms, and
lynx/CAB is asking if you really want to go along with this. Other, lesser
(but strangely popular) browsers don't notice that something odd is happening,
so the badly programmed script continues to proliferate.

From: s970707@hsins.uia.ac.be
Message-ID: <35f90659.5199167@hnets.uia.ac.be>
Source record: 94062

On Fri, 04 Sep 1998 21:41:27 GMT, paxton@accrington-web.co.uk
scribbled:

>There isn't that much you can do in JAVA that you can't do in
>Javascript anyway..

Do you realise what you're stating ? If that is true - and I believe
you, since I've never coded anything in JavaScript - then I'm REALLY
scared and suspicious of JavaScript (does it have a Security
Manager ?)

In an effort to clear things up for the 'average users', here's some
more glossary :

* Cookies :

HTTP is the protocol used to retrieve Web data such as HTML pages,
GIFs, JPEGs, etc. However, HTTP does not remember anything about
its past. So the next time you request the same page through
HTTP, the server-end has no way of knowing that you've been there
yet (usable for updates, counters, user tracking etc.). This is
where cookies come in : a server can send you a cookie when
you request something through HTTP. This cookie (e.g. containing
the data 'COUNTER=0') is then stored on your computer (i.e. the
client side). If you deny cookies or your browser doesn't support
them : no harm done. The next time you request a page, your browser
will scan its cookie repository (on your HD), and see if it has
any cookies for the server your connecting to. If so, then it
sends these cookies back in its new request. The server-end
then receives these cookies (or cookie) and can derive smth
from it (hopefully). In our example, it could e.g. send a new
cookie back with value 'COUNTER=1', thus implementing a very
basic counting mechanism.

Now, according to Paxton's explanation (correct me if I'm wrong),
JavaScript can create cookies on the client (your machine) without
the need for the server to send them to you. I assume JavaScript
can also read these cookies in some way, not ?

* JavaScript

A scripting language used to give web pages a bit of 'active
content', such as animations, mouse-triggered actions etc.
More details : ask Paxton ;-)

* Java

A programming language with its own OS and virtual machine. This
virtual machine could be seen as an ideal processor. The advantage :
every platform (PC, Mac, HP/UX, Sun, ...) that emulates the
virtual machine can run Java code. Disadvantage : emulation
consumes processor power (anyone remember PC-ditto etc. ?).
On the web, you'll find Java mainly in applets, little
Java programs executed on your computer, or servlets, which
run at the server-side. However, Java let's you also create
large applications with no relation the the Web.
Is Java a space hog ? Yes and no. Java processes consume a
lot of memory due to the built-in safety mechanisms (these
have nothing to do with security). But if C++ would have these
features too, then C++ progs would be such hogs too.
However, the Java code itself, is often very small. The size
of class files is measured in bytes or K's, not in Megs. Java
even has a mechanism to send all class files of an applet plus
its data (pictures etc.) in one compressed archive. This is useful
on the Web.

BTW, in the near future, mobile agents will be coming along...
(just throwing some oil on the fire ;-)

I remember it and yes it was the Parsec board, I have a review somewhere
although its probably at my parents so it would take a while to dig out. If I
remember it was pretty much a computer in itself and rendered most of the ST
as little more than a dumb terminal !! Charming ! It was very highly specified
for the time.

Dave of TUS developments and Veloce STe fame once boasted to me that he could
do an SVGA graphics board for the ST range for under 100 ukp. I think we
should bully him and make him do this ;) dave@tusdev.demon.co.uk ...

If you read this Dave, I was the man in the bar with long red hair at on of
the london Atari shows, 97? 96? who mercilessly badgered you over the Veloce
...

Charles and Steve,

I'm using CAB.OVL 1.3010, CAB 2.5. I've downloaded 11b but haven't
installed it yet. I'm using STing 1.15.

Would you guys jump over GATEWAY.COM and try to access their multimedia
or small business pages. I lock up here, and have been told these
pages contain JAVA based stuff. Also, TECHSTORE.COM's "buy" pages are
JAVA based, so we cannot buy anything online from them.

Oh, and Netscape is currently at 4.06. <G> That might be your
problem at work. 3.04 was the final release of the 3.x version.

I've not found Look to be particularly stable on either my Hades or my TT. :-(

For me, usually the CFG file gets screwed up. Once I have a working version, I make a copy of this file, and when things go wrong, I simply copy this backup file.

the rumour began with an IRC session with the Milan crew. One of the Milan guys explained how Steinberg's head honcho, who remains an Atari enthusiast at heart, is prepared to bring a Milan Cubase to light even if he has to do it in his spare time! Their is a URL with a transcript of the session but I can't find it at the moment. A soon as I do I'll let you know. I'm not sure what this means for CAF and I guess te project depends on Milan sales in general.

Derryck,

Pardon my late reply. I totally missed this post in my group listing.

Unfortunately, you won't be able to merge all those resolutions
together. If the resolutions are not listed in the appropriate CDD file
for the printer driver generator, you can't just arbitrarily select
what you want.

I could email you the drivers I was referring to if you would like.

MultiGEM is not a task switcher. Didn't work all that well for me. I
still have the disk here somewhere. I really liked Revolver, which was
a task switcher. So was the accessory Juggler. Flexcessory was
another attempt at pseudo-multitasking.

Because these scanners generally are not TWAIN compliant. AFAIK, the
TWAIN stuff is part of the OS, so any program that supports TWAIN can
use any hardware that supports TWAIN.

Use a program like Kobold that can select all files and change the
attributes on all of them in one go after transfer to HD. I do this quite
often with files from CD-ROMs and it's only a few seconds work with Kobold.

Kind regards

Mike Kerslake

5816. For Sale : STE and accessories

Newsgroup: comp.sys.atari.st
Date: 1998-09-11 00:00:00 UTC
From: Rob Fone <foner@thefree.net>
Message-ID: <35f97436.0@news.thefree.net>
Source record: 94086

Hi,

I have a 2Mb STE for sale. It has an extra composite video output (BNC type connector) suitable for connection to video equipment. The computer is in excellent condition, and I still have the original packaging for it. There is some software, including the original Discovery pack discs, included. Also included is my back copies of ST Format, and a few other ST mags. I have about 70 magazines. Most of the ST Format magazines are in 4 binders.

Also for sale is a 170Mb SCSI harddrive (the Sysem Solutions MiniS drive) with the appropriate SCSI -> ACSI adapter to make it suitable for use with an Atari computer. This has also been kept in excellent condition and has the original packaging.

Last, the printer. A Star LC-200 colour 9 pin dot-matrix printer. Colour and Black cartridge included. This is a very reliable and sturdy printer that has served me very well through the years. It can be either single sheet (A4 or smaller) feeded or there is a tractor feed suitable for rear or bottom entry.

If you are interested in any of this then e-mail me now. Anything bought is to be buyer collect. I live in Somerset, UK. Only sensible offers will be considered as I am quite attached to my Atari. Will sale as either entire system or separately if required.

Cheers,
Rob.

>With current hard disk drivers like CBHD or HDRDIVER there is no such
>limit.

Hmmm... I'm using ICD Pro 6.5.5 with the Falcon internal 84meg IDE, a Syquest EZ Flyer 230, and a Seagate Baracuda 4.29 gig drive. ICD can partition larger than 1 gig, although Cubase Audio (I've been told) might have trouble with partitions larger than a gig; I haven't experienced it though.

But I've got my Seagate partitioned into 10 partitons, and two of them are close to 1 gig in size (for recording from Cubase Audio), and the rest of the drive is divided up into smaller partitions. No troubles here.

Just my 2 cents worth.

Yes, you can convert them with Atari Cubase / Cubase Audio. I haven't had a
need to do this on my Falcon or STE, but I've seen the selection within the
program to do it.

My roomate runs Cubase VST on a PC, I'll check with him to see if you can
still convert the file types and let you know what I find out.

Can you do anything with a 520St with no disk drive?

I got one from Ebay with the monitor, but it doesn't have a Disk drive. The GEM environment comes up just fine and all, but you can't type, the mouse only picks a few menus.

no BASIC or anything?

I have a disk drive on the way, just wondering.

Tom

5821. operating System poll @ http://bengy.atari.org

Hello,
Well yesterday I put a short operating system poll on my webpage, the thing I am worried about is that because it is on the magiC suport page, im afraid the poll will not accuractly reflect which OS's are being used and to which extent.
So please, even if you dont use magic, go to this page and vite for what OS you use..
Im just doing this because im curios which OS is in the majority. I have a feeling it is still Single tos.
that url is

5823. New at Systems For Tomorrow! (September 11th 1998)

Newsgroup: comp.sys.atari.st
Date: 1998-09-11 00:00:00 UTC
From: sales@SystemsForTomorrow.com
Message-ID: <35f980c5.0@199.79.146.67>
Source record: 94093

New at Systems For Tomorrow September 11th, 1998
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Running for Falcon030 $29.99
Running is a 3D shoot-em-up in the tradition of Doom and Wolf3D. Features great graphics, smooth gameplay and enough enemies and weapons to keep the warrior in you happy. From Running Design Team.

Atari Compendium CD for TOS Computers $9.99
This one isn't new, but after being off the market for a while, it's back with a super low price. Contains the text of the Atari Compendium book in HTML format, plus tons of PD/ShareWare software.

Line Audio Products
We are please to make available the quality line of Falcon audio product from Line Audio. Right now all products are special order, so please allow two weeks for delivery.
Jam OUT 8 - $229, Jam IN 2 - $159, Jam IN 8 - $259
JamPro 2IN/8OUT - $379, JamPro 8IN/8OUT - $479
FAD 2IN/2OUT - $189, FAD 2IN/8OUT - $239, FAD 8OUT - $209
For more information on any of these products check out the Line Audio home page at www.lineaudio.se.

GEMTrade 2 for TOS Computers $19.99
GEMTrade will take a German document and produce an English alternative. It also includes a lookup dictionary to find the translation of a specific word. GEMTrade can even function as a module for the CAB web browser. German web pages can be instantly translated while on-line!

Apex Media for Falcon030 $139.99
Apex Media has long been considered the king of Falcon art and animation packages. Now, we have finaly been able to receive stock again. Apex Media includes a full suite of drawing and animation tools, morphing, true color filters and more. From Titan Designs.

Apex Intro for Falcon030 $49.99
This little brother to Apex Media is perfect for the average user that would quite possibly never use all the features of the Media version. It still provides ample drawing and animation tools, but gone are morphing, true color filters and non linear drawing tools. Also missing is $90 from the price! From Titan Designs.
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Crown of Creation 3D for Falcon030 $39.99
In the year 2060 the earth is in deadly peril. Two alien races threaten humanity. The only hope left is the newly developed LH14 space-fighter and you. COC-3D is a breathtaking true color space combat simulation that features outstanding Graphics, sound, gameplay and contols. Even has in film sequences. This is the best falcon game we have seen in a long time, quite possible the best ever! From RebelSoft.

Atari Computing Magazine #10 $9.99
Latest edition of Atari Computing Magazine. Includes: Reviews of MagiCMac 2, PixArt 4, SpeedoGDOS 5.7, ScanX, MIDIman, Suzy Bs v2 and Veloce+. Tutorials on Papyrus, STe sound programming, Hisoft Basic and the Team Tap. Plus all the usual Features and more. Includes Reader Disk. Subscriptions available. From Renegade Publishing.

ExtenDOS Gold for TOS Computers $39.99
The latest version of the best CD-ROM drivers! Now supports long file names, CD-R and CD-RW drives. Also now will save a CD-Audio track directly to your Hard Drive with most drives. We offer upgrades from ExtenDOS Pro for $25 with the return of you ExtenDOS Pro disc. From Anodyne Software.

CD-Write for TOS Computers $39.99
When combined with ExtenDOS Gold, and a supported CD Writer, this package will alow you to create your owen CDs! For Cubase Audio users this is a Must have! From Anodyne Software.

Falcon RAM card for Falcon030 $69.99
This Falcon RAM card from Germany allows you to expand your Falcons memory to 14MBs using an easy to find, and cheap, 16MB 72pin SIMMs. From WB Systems, makers of the Link 97.

Pinball Dreams for Falcon030 $9.99
This Pinball game for the Falcon isn't new, but the price is! Pinball Dreams features four tables of pinball action. It comes with both an RGB and VGA versions so it will work on almost all falcons with a color monitor. From 16/32 Systems.

Desktop Solitaire 1.02 for TOS Computers $19.99
Eight Solitaire card games in a GEM friendly application. New version now supports most video cards in 2,4,16,256 and 24bit color modes. Also includes several bug fixes, and the abitily to redeal the current deck. Upgrade DTS 1.0 to 1.02 for free, or check out the new demo, on the Systems For Tomorrow web site (look under Kordes Development from the main page.)

Scribble Synth for TOS Computers $29.99
This program is a software-based sound synthesizer. Scribble Synth is a true additive synthesizer, but with a difference, You actually draw in frequency envelopes with the mouse! The results are quite amazing. Strange Sci-fi Warbles, time-based pitch and

filtering effects, plus frequency modulated sounds are all
possible. From Electronic Cow.

EC-909 for STe/TT/Falcon Computers $39.99
EC-909 is an analogue drum machine emulator for the
STe/TT/Falcon. It features sixteen origional TR-909 sounds with
various controls. EC-909 can create single bar patterns in
real-time, and then export them into your direct-to-disk recorder
or sample editor as AIFF or AVR format samples. From Electronic
Cow.

MidiPlay $49.99
This is a player of MIDIFILE without additional hardware for the
Falcon030!! It plays the MIDIFILE with digital sounds! Features:
Play all the MIDIFILE following the GM norm * Up to 24 voices on
an normal Falcon * Each channel have a dynamic polyphonic voice.
* You can change the sound of current channel. * Function SOLO
(play only the channel), MUTE (not play the channel). * Viewing of
volume, information for each channel, bar, time, etc...

Live Machine $64.99
Live Machine is a D2D program for accompanying someone during a
concert. Live Machine can be controlled by MIDI messages! For
the Falcon030.

Also Available:
MIDI Arpeddiator $27.99 MIDI sequencer
Sound Chip Synth $19.99 Software synthesizer
Snippit Synth $29.99 Granular synthesizer
Atari Works $79.99 Easy to use home/office suite.
True Image $29.99 Image Processing Package.
Alien Thing (Expert) $19.99 Alien Blasting fun!
Desktop Solitaire $19.99 8 solitaire card games for TT/Falcon
All Things Falcon CD $9.99 Tons of Falcon PD/Shareware on CD
Hard Disk Sentry $39.99 Optimize that Hard Drive
Photo Show Falcon $9.99 View Photo CD discs on the Falcon
Card File 4 $29.99 Personal Information Manager
Moving Pixels CD $19.99 Software Collection /w sources on CD
ESG Clipart CD $19.99 IMG, CVG and GEM/s clipart on CD
True Paint $19.99 GEM based paint package
Plus about 400 additional products for your TOS Computer!

I believe the problem is that since the files are on CD-ROM, the computer sees them as write-protected (since you can't write to a CD-ROM) and keeps that status when you copy them to your harddisk. I'm not sure if there's anything to do about it, but it would have been nice... A task for Kobold maybe?

>sequencer. I haven't heard the Cubase 3.0 program yet, but I queried
>about sequencers in the past and this seems to be the favorite.
>Is Cubase 3.0 as "tight" as the Hybrid Arts?

Hi Dwight,
I've used Cubase since the first verision - and previous to that I used PRO24, also from Steinberg. Now I'm using Cubase Audio on my Falcon and in no version at all have I experienced ANY timing problems (except when testing pirate copies ;)). I believe that Cubase is beyond competition both in functionality and being user-friendly. I know there are Logic-users who don't agree and I know there are some functions in Logic that are better than in Cubase, but I still say that Cubase is better and easier to use.

Good luck,
Claes

>get one (UK)...

I've used both standard and EDO without any problems, but some SIMMs don't work. It's something about how they're configured, with 4 or 8 bits or something like that. All of them work in PC's, but not in the Falcon. I use a Goldstar (LGS) EDO SIMM in my Falcon. I seem to remember that Siemens SIMMs didn't work, but there are probably others too. If you get one of the ones that don't work, you'll just get a totally black screen. Just put the original one back (don't forget to change the jumper on the RAM-board) and the computer works again. Then get the SIMM exchanged to another brand or model in the shop - be certain that they'll let you do this when you buy it.
You can use just about any speed available, it isn't sensitive at all (if you don't hunt down old 100 or 120ns, but I doubt you can get such beasts anymore). I believe you should use 80ns or faster and you probably can't get hold of slower than 60ns today.

Best regards,

5831. [problem]Falcon:Cubase Audio

Newsgroup: comp.sys.atari.st
Date: 1998-09-11 00:00:00 UTC
From: brian@tos.pl.net
Message-ID: <OOI2CPM@tos.pl.net>
Source record: 94133

I have had many replies to my post regarding problems with this program.
But still no conclusive answers.

Some say the garbled audio on playback problem is software, but how is it
then that for extened periods of time this problem was not apparent?

Also, some CAF owners never, or rarely have this problem.
Also, some say they never have crashes in the audio editor.
(would you like to swap a life!!)
(The other problem was crashing in the audio editor)

We have checked the usual clock mod issues and are needing further
assistance. They appear to be fine in these C-LAB MK X machines.

We have found various 'get-arounds' to avoid the problems, but the
questions still remain unanswered.

Also, I was hoping to get other owners to try out the several things on
their machine to see if it could be established if it was the same in
every case. This would help sort out the problem.
But while many replied, no one seems prepared to work with me trying out
the same procedures on their machines that I have to establish some known
'constants'.

So I am hoping that if you read this message and own a Falcon with Cubase
Audio or know others who do - that you would contact me with a view to
helping me work through the problems. This amounts to simply following the
same procedure that I have to see if we have the same results or not.

I would also like to contact people who have a very technical
understanding of how the falcon works.

All feedback and comments are much appreciated

>
That's exactly what it was! I decided to open up the drive to clean the heads manually, and indeed the opposite side is a felt pad. The cloth cleaning disk might have wrecked it. (For anyone who cares, it's the bottom side of a single sided disk that gets written to)

After cleaning it seems to read disks more reliably, but I'm still having some trouble writing to and formatting disks.

I noticed that this drive has a rubber belt--have these been known to go bad?

I have an old 520ST with an SF354 drive. I opened it up to clean the head, and I noticed that it works using a rubber belt from the motor to the platter. I'm having trouble formatting and writing to disks. Is a worn/stretched belt a common cause of this in these drives?

5836. Anyway to convert Pro24 .sng -> .mid on PC?

Newsgroup: comp.sys.atari.st
Date: 1998-09-11 00:00:00 UTC
From: CurtBrown@my-dejanews.com
Message-ID: <6t9vc2poj1@nnrp1.dejanews.com>
Source record: 94138
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I know this question gets asked occasionaly (and I know it seems more like a PC question) but you never know what new utility may be out there.

I have the last version of Pro24 (ver 3) which saved files in .sng format. For some reason it always had problems converting these files to .mid format, and now that I'm having trouble saving files with my drive it's not likely I can do this at all on my ST.

However, I can get these .sng files over to my PC using st2dos. So, the usual question: is there anyway to convert the Pro24 .sng files to .mid on a DOS/Windows PC? (I realize that there were several ST sequencers which used .sng as their format, but I believe they were all different, right?)

I have read that you could change the .sng files to .all format using the ST version of Cubase, but what about the PC version?

> P.S. There's various versions of SSL.

Charles, When I sent the order there was a message at the bottom of the window stating that they used SSL for security reasons. I was kind of surprised as I did not think that Dan had implemented SSL in CAB.OVL. There was no option for sending the information any other way. Maybe its there and even Dan doesn't know it :).

As a matter of fact, at least one developer is going to use the net to distribute their software. ROM (Papyrus) is going to use e-mail and credit card (Visa and Diners Club) to send/accept payment for the next version of Papyrus. Did a quick check of HiSofts web page and all Atari support is gone. Like you, I wish more dealers would opt for this method.

Steve

Not to be prude, but why not?

MPLAYER displays AVI's and MOV's at full speed, surely faster than the
data can come over the serial line. And if the Falcon can record and
play back at the same time, I would think that an application could be
wrote to handle the audio data rates that occure over a modem. Mabey not
```

640*480 24bit 30fps (what machine can?) or 44.1kHz audio, but unless your talking about being on a 10/100 base T or cable modem, it would only take a programming effort.

2 cents

MG

That reminds me of a strange corrption with NewSie
Running TT N.AES + Thing
de file with the newsgoup info corrupted.
Reason: Thing takes a file with .GRP as his own 'grouping info file
and rewrites it with current Thnig-workgroup settings.

Maybe something like that here?

I'd strongly suggest you download Trackman from
http://www.hollis.co.uk/john.

This was an expensive commercial sequencer that's now been released as
freeware. It will run on a 520st and with a colour (or color) monitor.

Very user friendly and well worth a look.

Hello all. Recently my Atari ST 520's floppy drive crashed, 8*(, and I'm looking for a replacement. I'm also looking for any programs for the ST with which I can run a BBS with. I'm planning on putting my BBS back up with an '80s theme, and what would be better than putting it up on an ST. I'm not interested in purchasing or trading for the BBS program, a copy of the original disk(s) will suffice, but I will give you like a buck or 2 for your troubles and will also pay for shipping. I'd perfer to get this stuff from within the US, but will trade internationally if needbe. Thanks.

Hi Ronald,

mmmm, not likely. First of, Thing keeps .GRP files in its Thing directory
(at least, if you'd install "normal installation"). Then, Newsies
Default.grp normally would sit in "Work". I've got these installed like
that, and I do have quite some GRP files set up in Thing. No problems
whatsoever...
Even then, Thing wouldn't touch Default.grp unless perhaps you have a Thing-
group set up like that with the file parked in Newsie's Work directory :-)

BTW, William Platt: I'm using Newsie 0.90 ever since it was out, normally
I'd run MagiC (and Yes, I did put three LIMITMEM.PRG's into my Autofolder)
and ever since I stopped the bug (running Newsie 0.84 at that time) I
haven't seen it back.

Hi again,

OOOOOOOOPS, I said the Adamas browser looks nice, huh? Well, as long as it's empty... loaded my own homepage from the HD, the GIF's didn't look right as long as they were displayed, then the infamous "Speicherblock zerstoert durch benutzerprogramm" message came in...
Tried it with "no pictures", then it loads fast and looks OK, but without images. Next tried a setting again with Images active, and next MagiC started complaining again...

O boy, I'm not giving up on MagiC. So.... sorry Adamas, and then I won't need Draconis either...

In other words: short experiment :-(

to ticked.
BTW, I tried with not ticked, no difference.
- The TCP/IP config section has a line "Host"... what's that one supposed to contain? (Yes, I'm dumb!) I know the "domain"... but can't figure out "host". Since my ISP's support line is down till monday morning, I'd better ask here...

Right now I'm using the terminal window to enter all log-in stuff; that seems to go well (with the stuff I set in Sting's Dial.scr). I put together a script file for the login according to the info in the docs, but that wouldn't work at all, the whole stuff froze up. Using the terminal window at least you can control input yourself.

Note: I tried both with Sting still active in the autofolder and with Sting de-activated, but no difference at all.

Draconis gives me a boot message that the driver IS installed...

So if someone has clues, ideas, suggestions, alterations, I'd be GLAD to hear. I had a look at the Adamas browser, it sure looks nice, but I can't get any homepages into it from the net.

CU NeXT msg,

I guess it's just the fact that I've never seen this diaolg box pop up before,
and when it did, I more or less immediately posted a question to the newsgroup
without going back to re-read the doc file. (the easy way out!)

I'm still not quite clear on this redirection problem. Is this something that
caused early OVLs to freeze up or crash CAB?

I must have been lucky to miss this problem in the past. Oh well...

>Thanx.. :-)

Yes. I'm using Cubase Audio 16 on my Falcon (which MIDI-wise, is the same as Cubase 3.x on an ST), and you can load Cubase SONG (.ALL) files, Pro24 (.SNG) files, and MIDI (.MID) files. And, once loaded, you can simply SAVE them as whatever file type you want by ticking the appropriate file-type box.

Easy, no fuss... ;^)

5859. Atari to Win98 Syquest carts?

Newsgroup: comp.sys.atari.st
Date: 1998-09-12 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6tei4r$lqb@enews2.newsguy.com>
Source record: 93961

Is it possible for a PC (Win98) to read an Syquest EZ135 from an Atari (or the other way around)?

In the past, I've transfered files to and from PCs with floppies without problems. However, My roomate (Win98 PC) and I (Falcon) were attempting to swap some large audio files - too large for floppies, and very time consuming to send as e-mail attachments, and were unsuccessful.

We both have external SCSI EZ135 drives, but neither of us can read the other's format. His PC says the (Atari formatted with ICD) cart is UNFORMATTED, and when I try to use the cart formatted by Win98, I get error messages - as if there is no cart in the drive. I'm pretty sure the Win98 FAT32 filing systems is one of, if not THE problem, but my roomate doesn't know how to format the cart any other way.

I've seen mention of a utility here called st2dos, but have not tried it. Is this for floppies only?

Any suggestions or help, or am I trying to do the impossible?

>Maybe something like that here?

Well, I (currently) don't use Thing. But The newsgroup .GRP files are easily corrupted in NEWSie. If there are problems with the newserver, or if I have been connected, then disconnect, and try to open a .GRP file, the names of the newsgroups in the .GRP file will turn to jumbled random characters, and I'll have to re-copy the .GRP file from a backup. So, I always make sure that after getting articles to read offline, I QUIT NEWSie, disconnect from my ISP, then re-start NEWSie before attempting to read the messages. That way, NEWSie doesn't attempt to connect to the server when I open a .GRP file. This method is mentioned in the NEWSie DOC file as well.

5862. Draconis stuff

Newsgroup: comp.sys.atari.st
Date: 1998-09-12 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <905633442.14866.0.rover.c3adfca1@news.demon.nl>
Source record: 93964

Hi all,

heck, I'm reading my own stuff and it's not OK: 2 messages got mixed up but I still don't know how...

The first one should have read something like this:

I fetched the Draconis package from the FTP site, installed it (and it has a very nice installation program), but on the dial-up to my ISP it wouldn't ping. Everything was set at what (I think) it should be, but after a "connection established" message it wouldn't ping at all.
So I had some questions about the settings, but later I discovered that Adamas won't work OK with "pictures enabled". That means I can't use the browser, so why would I need Draconis??? This explains the line "short experiment".

Too bad, but Adamas is crashing under MagiC, or you might say "MagiC crashes due to Adamas" and since MagiC is my standard OS, I say: goodbye Draconis/Adamas etc.
Well, maybe it works on a Milan...

CU NeXT msg,

5863. Pro24 to .MID (Cubase PC)

Newsgroup: comp.sys.atari.st
Date: 1998-09-12 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6tejcb$lqh@enews4.newsguy.com>
Source record: 93965

Recently, CurtBrown@my-dejanews.com wrote:

>is there any way to convert the Pro24 .sng file to .mid on a DOS/Windows PC?

Well, I checked my roomate's version of Cubase VST (PC), and there doesn't even seem to be an IMPORT option for .SNG (Pro 24) files. There is for .MID (standard MIDI) files, but that seems to be it. So, I would suggest loading the .SNG files into Cubase Atari, then re-save them as either Cubase song files (.ALL), or as .MID files, then import them into PC/Windows Cubase.

If you don't have a huge amount of .SNG files to transfer, you could e-mail them to me and I'll re-save them as .MID or .ALL files in Cubase Audio Atari and send them back to you (since it sounds as if you either don't have access to an Atari, or to Atari Cubase).

I just received issue #8 in the mail from Rich Tietjens along with a letter informing me that all his subscriptions have been transferred to Systems for Tomorrow. I checked with Kent and he, indeed, has received the information from Rich but needs a bit of time to go through the information.

So, I suggest we all sit back and give Kent a week or so to clean up this mess and not bombard him with questions regarding the status of our subscriptions.

This is good news and we can all, hopefully, put the bad feelings behind us.

Pat

I'm not 100% sure but I think
"Host" is in your case "holleman" and "Domain" demon.nl

>
>Note: I tried both with Sting still active in the autofolder and with Sting
>de-activated, but no difference at all.

I tried it once long time ago. AFAIR there was only one problem. I
couldn't disconnect.
I just tried it again. No probs to get connected. The installation is
really straightforward. Even the disconnection worked now.
I had big troubles with the public webcounter (pagecount) I use on my
pages. Adamas doesn't display the counter. I followed the link but Adamas
crashed at this point. Coloured tables borders and table background colors
aren't supported.
Resizing the window whilst I was online killed Adamas.
After five minutes I had enough.
Still a long way to go but IMHO it's a better browser then Wensuite.
Talking of Wensuite. I heard some rumours saying that the next version of
Wensuite (v3) will be demonstrated at the forthcoming Neuss fair.

Body handling: Binary attachment payload not displayed: pacman.vcf

Hey guys,
here are the current results of the operating system poll that I put up
just about 2 days ago:

MagiC - 10 votes 38%
Single TOS - 5 votes 19%
MiNT (Geneva/MiNT,N.AES, Mtos etc) - 4 votes 15%
MagiC Mac ** No votes! **
Geneva- 6 votes, 23 %
Stonx, winSton, GEMulator, pacifist etc - 1 vote, 4%
MagiC PC *no votes!*

26 total votes so far.
Wow, I have to say Geneva is really surprising me. For some reason I had
thought there were very few geneva users left!
I am going to keep this vote up until EVERY atari user votes :-)
If you know an atari user who does not have inet access tell me which OS
he uses and I will add his vote. Also If you would wrather just email
me with your vote instead of going to my site thats fine aswell :)
Anyways, exercise your right to vote! :)

There were problems in 0.88 and before dealing with the .GRP file:

What's New in NEWSie 0.90

Bug Fixes
NewGroup article count remaining incorrect (maxarticles VS OVERVIEW_SIZE)
Mail send/reply/forward garbage when no message selected
Prevent possible File handle corruption, open file in generic_detect_uuencoded()
Detect and prevent use of negative indexes in various places (bad)
Replace strcpy() with strncpy() where necessary to prevent string overrun(s)
'InBox Full' - InBox not sized (count_lines()) before get_mail() processing
Overview displayed previous articles when overview file was empty, corrected
```

--> Parsing Newsgroup responses could cause loss of newsgroups when ESC key pressed
Window toolbar was not reset when changing resource files
Sort percent for full/newgroups could exceed 100% in display
'Mark All Read' is now ignored when Newsgroups Overview is empty
'Show Headers' in Mail Options dialog did not refresh like News Options
Expand datetime field to include last digit of year in outbound mail
Refresh for browser url dialog is bad on left edge of screen (x<=0)

If you're not using 0.90, get it, otherwise wait for 0.92 (in beta).

Yes, the manual says (page 28):
ATARI Works makes use of an error in an ATARI VDI routine when
marking blocks - NVDI doesn't. ... Switching on `Error Compatibility'
in the CPX module will stop [it].

As to the actual printing problem, the Drivers CPX that I have shows
`DeskJet 500' in the lost of printers: perhaps choosing that option
would suffice for a 540.

Cheers, Charles.

5870. Next WAG Meet

Newsgroup: comp.sys.atari.st
Date: 1998-09-12 00:00:00 UTC
From: felice@zetnet.co.uk
Message-ID: <6tevnt$l5g$1@roch.zetnet.co.uk>
Source record: 93972

This is a quick note to remind you all that the date of the next WAG meet is about 1 month away.

Seriously, we need more members to turn up and replace our rapidly depleting ones !! ;) If you can get the train to Whitchurch, the fire station is within an easy walk away. Come along and meet us all - you'll all be VERY welcome !! ;)

The meeting is set for 2pm on the 26th October at the Whitchurch Fire Station (thanks again Roy).

The main purpose of the meeting will be as an AGM so if you can attend it would be appreciated.

Lastly can you reply via email me to tell me that you have recieved this message please. I'm going to be sending out written messages to the other members of the group this week so that they aren't left out, if I haven't had a reply from you by 7am Thursday morning I'll be adding your details (providing I've got your Postal address) to the list just to be sure.

Visit the WAG web page at www.users.zetnet.co.uk/rgoring/wag/.

Thanks
Simon & Richard

Omega is a great program, difficult to learn but easily the most
powerful sequencer available.

But....I *know* it's not very popular. There are several other
sequencers available, some public domain, that provide yer basic
editing features. Try http://www.hitsquad.com/smm/atari/ .

> files it actually doesn't have control to, which might cause problems later
> on.

This cannot be emphasized strongly enough ! NEWSie obvious "changes" these
files without employing GEMDOS functions. Since it does not access the hard
disk driver directly either, it must work by corrupting GEMDOS internal
structures. Such a bug can have much more serious side effects than just
modifying two relatively unimportant (for the rest of the system) files.
Basically this means the entire partition is at stake, any file on it can
become corrupted this way. Imagine it to be the main directory or even the
FATs, the whole partition were lost !

> Appearently (for the moment to me, that is) Newsie's screwing around
> with your STX files... You *may* try out by setting them to Read Only, but I
> did just that with those Route.tab and Cache.dns and it didn't make any
> difference.

Obviously not, as the read-only flag is interpreted by GEMDOS, and I pointed
out above that the corruption does not go the normal GEMDOS way.

If you're a newbie, then you shouldn't use beta versions. Beta versions are
such because the author knows they might contain bugs the effects of which
are very hard to separate from the effects of a newbie's misconfiguration.

It's the Microsoft world that made everyone believe that betas are just as
good as final software. Maybe it's because Windows never made it out of
beta status ... ;-)

You've probably filled in some form, maybe a search entry at a search engine.
Of course the text filled in must be posted to the engine, why is that so
uncomprehensible for you ?

Repeated redirection is probably a bug at the server's side.

> I was asking here. Perhaps a little explanation for those of us who aren't

>I'm still not quite clear on this redirection problem. Is this something that
>caused early OVLs to freeze up or crash CAB?

I'm not sure, TBH. I think before it would sometimes just not get
you to the page you wanted. It did the same thing before as pressing
"Get" does now (the default). If you ever come across a page where
"Get" doesn't work, you'll know what it did before. ;^)

Actually, I had that happen the other night, and it brought back up
that alert. I tried re-post and that worked. I guess under the old
CAB.OVL it would have just produced an error in CAB's info line.

Try using TypeArt on the PC. You can export a CFN back to its original TTF format, and preserve the original hinting and enhancement which were embedded when the TTF to CFN converter was applied to create the original CFN (unless the CFN was created from scratch.) Remember to choose the correct language encoding.

Message-ID: <0C1C2B25C72C4CD9.465E92E793EAE2EB.581BEE94CDB8EE2C@library-proxy.airnews.net>
Source record: 94013

Does anyone else tried using those maps on the search engines?
When I input all the info and try to retrieve a map it will correctly
fill in the entire page except the map.

I've also had some difficulties retrieving articles from newspaper web
sites where a CGI actually builds the page and delivers it. I will
see nothing on the page besides a few garbled characters and if I
reload, CAB crashes. I wondered if the two problems are related.

I use CAB & CAB for MiNTnet but have also tried the same thing with
the STiK OVL with the same results.

Any ideas anyone?

5881. Best MIDI sequencing for 1040ST 1Mb????

Newsgroup: comp.sys.atari.st
Date: 1998-09-12 00:00:00 UTC
From: Stephen <sca964@home.com>
Message-ID: <mhlK1.297083$sb4.16532130@news.rdc1.tx.home.com>
Source record: 94016

What is your opinion??? My setup consists of the 1040ST, 1 Mb RAM, (2) 720k disk drives and a color monitor. I have Dr. T's Omega. I don't particulaly care for the program so I still sequence on a SY77.

My ST has DRAM memory; I can't expand the memory above 1 Mb without performing major surgery.

Then there is the issue of even finding a program such as Cubase. If I was to upgrade my machine I'm not sure where I could find a legal copy of Cubase.

So there it is; Stay true to Atari; or sell my machine and my copy of Dr. T's to you guys.

Thanks in advance....

Hi

What a dilema!!!!

I don't know if this will help you as you will have to make your own mind up, we can't make it for you;)

I come across a hell of a lot of musicians, these people have pc's but find the humble 8Mhz machines more comforable to use than the pc versions. So I wouldn't recommend getting rid of your Atari yet!!!

There are copies of Cubase around, you will need a mono (hires) monitor to use it though. I also recommend you change your Atari model to an STE, this would allow you to upgrade to 4meg easily and prevent the memory restrictions of having 1meg with Cubase.

> pages contain JAVA based stuff.

Ken, pages loaded fine with CAB2.7 Demo and CAB.OVL 3.011b. The problem may one of "redirection" as I got a query from the ovl to get to the pages. Could not find a "multimedia" section, but all the others I tried worked just fine.

>Also, TECHSTORE.COM's "buy" pages are
> JAVA based, so we cannot buy anything online from them.

Well I tried a couple of times to get my personal info accepted, but to no avail. Again, the problem may be one of redirection of the "Post" as I kept getting an alert box from the ovl. On one try info did get sent and accepted but I got dumped back into the "guess" area. I did look at the source file for the info page and could not find any reference to Java, but did find the following :

<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 3.2 Final//EN"> and

<!--- TechStore HEADER --->

```
<SCRIPT LANGUAGE="JavaScript">
<!--
if (navigator.appName== "Netscape" && parseInt(navigator.appVersion) >= 3
|| (navigator.appName != "Netscape" && parseInt(navigator.appVersion) >= 4))
{

I need to find the original ST-Ram card from Atari, which provides
8 Mb of ST-Ram in addition to what's already on the TT motherboard.

E-mail me the details and your price, if you have one for sale.
Thanks.

I know... is anything cheap at Best or B & C, anyways?

Either ways, my AixTT-64 just gave in, so my TT is currently DOA.

Basically, since moving to Finland, my TT-ram has behaved weird.
At first, I thought the problem was the SIMM itself, so I bought
a new 32 Mb module. Nope. The AixTT killed that one too.

However, the TT works fine if I remove the TT-ram card, except
that 4 Mb is basically useless under MiNTOS.

Currently, I'm trying to convince Aixit that they should repair or
replace the card (and the damaged SIMMs!), but the response isn't
too encouraging...

That AixTT card already costed me a fortune (ie: I paid less for
the TT itself!), so they better support their product adequately...

I am NOT interrested in buying their newest thing. I already paid
a LOT of money for this one and now it's not working...

Basically, since there are no alternatives to the AixTT, I would
rather move out of the platform and get a good Unix box that waste
money on something I already paid for...

...unless Aixit responds properly and replaces the broken goods.

I've just found a text file by Jo Even Skarstein on the web which tells how
to install an internal dot clock - with just 3 wires to connect from a TTL
oscillator it looks like a winner. The best bit is that if you switch
Nemesis to low or off you don't lose the display.

Has anyone tried it?

Perhaps the best supported palmtop is the Psion Series 3X and Sienna range, there is a suite of utilities written by Keith Baines that will do practically all you want including searching database files and converting from Psion's WRD format Word files to ASCII. There's an OPL editor too.

It's not on the web AFAIK but you can get it from the FaST Club.

That's presumably because the files are read only on the CD-ROM.

If you use Extendos Pro you can set a flag in the config to change the file status to R/W which will do the trick for you.

Hi,

Does anyone know of anywhere in the UK where I could get hold of a RAM upgrade board for the ST ? - I've got the simms, just need the board, ...oh, and a SCSI host adaptor too.... (once again, got the drive, need the H/A !)

I've tried searching the web, but find nothing in the UK.

Many thanks in advance,

Cheers,

Kev.

You are absolutely right BUT we are not talking about the same *.FLM !
M_Player will be useless for this task ... it exist two kind of FLM
... the one coming from VideoMaster and another which is supported by
M_Player ...

Kommentar zu A16589@LU
Hello Spencer,

m>> os
m>> --
m>> OS9
m>> Linux
m>> TOS
m>> Magic
m>> MultiTOS
m>> MiNT(MiNT and nAES/Geneva/xAES/oAES)
m>> omen
S> Add to this SMS2 and Mirage, plus there was another multitasking
MultiGEM (AFAIR no OS, just an enhancement)

S> Also mustn't forget NetBSD.
EUMEL/ELAN (a text oriented multitasking, multiuser OS, especially
designed
for word processing, University Bielefeld, Germany)
RTOS/UH (RealTime Operating System/University Hannover, Germany - although
it
sounds similar, it's not compatible with TOS, but widely used)
MINIX (royalty free UNIX version from Tanenbaum, Michigan(?) University,
USA)
Ksomething (KDE?) (an experimental, graphical multitasking OS published by

the leading German computing journal c`t)

And I suppose:
CP/M68k (the father of GEMDOS, but I don't think, that it has been sold)

At least, there is EIFEL, an OOPL. I really don't know, whether this
programming language runs on TOS or brings its own OS with it.

m>> emulating:
m>> MACintosh68000
m>> PC-DOS and Windows
m>> Atari 8bit
m>> Amiga (haha)
S> and to this QL, Spectrum, TRS80, BBC B, Commodore 64, Apple II
ZX81
CP/M (and the Z80 of course)

Something forgotten? :-)

PS: "Emulating" the 68k Mac sounds slow. In fact, the "emulation" was
faster

than the Mac at that time (the old classic one) and had a bigger screen,
so
Pagemaker was able to display a DIN A4 page at full width on 100%. :-) At

least, the first "Macintosh laptop" was the ST-Book (which was even used
as a
Mac laptop by a German insurance company using the Mac emulator Spectre).
As
time goes by ... :)

Greetings, Oliver

solution - scout around for an STe, as that can be upgraded with
SIMMs (one of TAF's members recently found an STe at a thrift shop,
complete with mono monitor, for $20)

>
>Then there is the issue of even finding a program such as Cubase. If I was

well, there's TrackMan, which has now been released in the Public
Domain and was featured on the Atari Computing reader disk an issue
back - that will run nicely on a one-meg machine. If you do upgrade and
need Cubase, your nearest Club Cubase should be able to find you a legal
copy no problem - where are you located?

Systems Solutions has the Marpet board available again; also, I
believe The Upgrade Shop also sells a SIMM board. Those would be your
two UK places to try.

> group set up like that with the file parked in Newsie's Work directory :-)

This evidence against, is *very* weak. Remember the bug strikes by corrupting
GEMDOS internal data, which on the next write action to the hard disk corrupts
some file due to those corrupted working parameters. The slightest change of
circumstances makes such a bug corrupt entirely different data, and entirely
different data will be effected. Thus entirely different files will get
corrupted. Such deep in GEMDOS, "neighborhood" of files like being in the same
directory etc. has no meaning, therefore the bug can well corrupt *ANY* file
on the hard disk. Even a different partition could be effected (even though
less likely). There is no reason why some file should be more likely than
another only because one is in the same directory like NEWSie or STinG. I
emphasize : *ANY* file can become corrupted and this is why this bug is so
dangerous. I would not be surprised if people who suffered from this bug have
dozens of corrupted files on their hard disk, only undiscovered since the
files have not been accessed lately.

> BTW, William Platt: I'm using Newsie 0.90 ever since it was out, normally
> I'd run MagiC (and Yes, I did put three LIMITMEM.PRG's into my Autofolder)
> and ever since I stopped the bug (running Newsie 0.84 at that time) I
> haven't seen it back.

I'd be glad if the bug were fixed, but I'm not as sure it is. This bug, as
explained above, has the potential of hiding itself very effectively, by
corrupting apparently unrelated files. It is well possible that it is now
corrupting some other file which you only haven't viewed for a while.

Cheers Peter

Hi Martin,

well, actually I've been playing a bit more with the stuff, also on my TOS partition with the Matrix card drivers. Strange enough, I could hook up to the ISP with PPP OK, the ping was fine too. It still won't go from MagiC, tho'.
Adamas works only with all images disabled. When I set it up like "display after loading" the browser simply crashes under TOS, under MagiC the whole system crashes! The first images goes onto the screen (but sure doesn't look right) then the browser/MagiC crashes.
I've tried the Marathon e-mail client, but both under TOS and MagiC it crashes... As you said: a lot of work has to be done!
>>
>>- The TCP/IP config section has a line "Host"... what's that one supposed to
>> contain? (Yes, I'm dumb!) I know the "domain"... but can't figure out

Well, I filled these in like that and again: it's OK under TOS but not under MagiC.

>After five minutes I had enough.

About the same here, tho' I couldn't connect to my own homepage while online... The only way of getting something out of Adamas was loading HTM

files from the HD here.

>Still a long way to go but IMHO it's a better browser then Wensuite.

As temporary solution, wouldn't it be possible to have the CAB
HTML-parser omit all tag sequences like '<SCRIPT ...>....</SCRIPT>' ?
Of course, Web pages would turn out incomplete, without flashy mouse-
triggered animations and such, but the page would be showed. How does
CAB handle such sequences *now* ?

>Ahh, I saw one link that used a java applett. All the rest is JaSc.

I admit that for most applications in Web-pages, JavaScript is
probably a better/easier/whatever solution than Java.

I also just made the move to MagiC and can't believe the difference.

I use GEMvelope and have not seen a problem so it must be an
incompatibility which is solvable (and I've been lucky). I'm using NVDI
4.12; don't know if that minor update makes a difference but it's
available from Systems for Tomorrow. How about AUTO folder ordering?

From: louis@holleman.demon.nl
Message-ID: <905705079.427.0.rover.c3adfca1@news.demon.nl>
Source record: 93901

Hi Atarians,

well, just another f...ing rainy, chilly sunday over here. Time to sit behind the TT and fiddle around to "upgrade again".

You've heard about my experiments with Adamas/Draconis/Marathon. Well, maybe next year again...

This time I was reconsidering the use of Newsie (with relevant problems) and fetched some replacements from the web. For E-mail that was MyMail (Erik launched an upgrade this morning) but to tell you the truth: Erik's link is terrible. IF you get a 250 cps download at all, then there's every now and again an interruption in the transfer, so after 2 tries I decided to do it different: went to Flinny's site and fetched the slightly older 0.64b version, at least at a decent cps-rate. BTW: those transfer problems at Erik's site are known to more users! Erik, do something about it.

Anyway, I installed MyMail and sure it looks OK. Lotsa gimmicks and it even works here... Only thing is selection of other fonts gave me hell again. Why is it that programs expect UFSL font selectors and if they don't find it they crash??? MyMail isn't the first one... Heck programmers, we've got the AV-protocol on Atari, so I've got my Thing fontselector and that one should do the trick. But MyMAil simply states "no UFSL fontselector installed", next displays the fontbox and crashes at the same time... I can't find a "font entry" in the config file, so editting manually is out of the question ATM.
Apart from that: looks/works OK here. Maybe it's the final successor for the Newsie E-mail part.

Remains the news-part of Newsie (I replaced the FTP part already by A-FTP, another nice program).
I fetched Firenews 0.75, but it looks like I need Newsie too to operate it decently. Couldn't get it to fetch news at all, let alone to display it. Probably another set up for wizards, and that's not what I am...

Well, after sitting behind the keyboard from 11.00 till 18.30, I decided to cook some pastafood, open up a Chilean wine and have an evening off.
If someone has a nice replacement for newsgroup handling (without the need of 5 other programs, or it should be Sting) I'm just sitting here and checking the news- and mailboxes every now and then. Oh yeah, preferrably ones that allow installation of other fonts than the bl..... f..... Atari systemfont without needing UFSL/XFSL.

Have a nice evening, you all!

CU NeXT msg,

```

5920. Pacifist and Linux?

Newsgroup: comp.sys.atari.st
Date: 1998-09-13 00:00:00 UTC
From: B O'Donnell <odonnllb@indigo.ie>
Message-ID: <35FBF687.391C1FA2@indigo.ie>
Source record: 93902

This may not be the right group; if so, my apologies.
Has anyone managed to get Pacifist to run under dosemu? It stops on my system with an 'unrecognized DPMI instruction 08', which suggests that it's using a different DPMI version than dosemu's 0.9. But that's as far as I can hazard a guess.
I know about STonX, but I would prefer Pacifist; my eyes aren't great (just presbyopia:-)) and fullscreen is easier on them.
Regards
Brian O'Donnell

Hi AtariMad,

A-B-S-O-L-U-T-E-L-Y-!!!!!!!!!

IMO the first commercial stuff any Atari user should buy...

Bought the first one only a few years ago (3.02 regular), but since it's on
my disk I go crazy when using a setup without it...

I bought the 4.12 Matrix version beginning of this year straight from Behne,
because the card drivers weren't good enough. The extra speed only added up
to that.

Version 5 handles all gfx cards now too, so you don't have to buy extra ones.

I read some articles about MagiC, which actually is a rewrite of VDI too,
where the authors stated "you don't need NVDI any longer for more speed".
WRONG... I still have NVDI under MagiC, not only to drive the card but for
some extra speed too.

So is it worth the money? YES!

I tried it, and went back, at least temporarily, to my old 1.09e. I may be
wrong, but I found NO WAY to display the directories in the old format,
including size and date! Am i wrong? If there is some way, could anyone
po8int it out to me? I find the size and date indispensible to me at
times.

You need a Motorola 68882 coprocessor. It is very easy to install.
You just plug it into the socket under the power supply. No software
required. Any software that makes use of the copro will find it.

Rich.

>
> somewhere I have in my mind you could expand ST RAM to a maximum of 10 Mb...
> and indeed, the only need for more ST RAM are the bloody lasers...

Actually, both the TT and Falcon can handle up to 14 Mb of ST-ram.
The remaining addressing space is used for hardware control, thus why
you cannot go beyond this (no problem on ST though, thus the Magnum-ST
from Aixit allows up to 15 Mb on a plain STFM).

Someone out there really should make us a 12 Mb ST-Ram card... ;-)

> So either Aixit screwed MABN or MABN screwed me....

The same could be said of Computer Direct:

It's still not clear wether suppliers screwed CompDirect
or if it was the other way around.

> But I'm still in the market for an upgrade, since my 4+16
> Megs are far too less for decent MT.

I only have 4 Mb of ST-Ram, if my AixTT isn't fixed soon...

Either ways, I really want some more ST-Ram, especially when
testing Falcon software that has been ported for TT hardware.

No problem with that overhere, at least not on 256 color mode running
N.AES/freeMiNT 1.15b-2.9/Thing 1.27.
The pictures, even the animated gifs looks just fine.
He, I just found out that when I'm working in 24b mode my whole system
hangs as soon as it try to load pictures into Adamas. It surely doesn't
like graphics cards.

>About the same here, tho' I couldn't connect to my own homepage while
>online... The only way of getting something out of Adamas was loading HTM
>files from the HD here.

As I've said before. I could load my own pages. Adamas crashed only when I
tried to access the pagecounter. This goes for 256 colormode. True color,
forget it.

>>
>Well, if Adamas is better than Wensuite, I won't go to Neuss :-)

You'll miss lots of interesting things then.

It's surely better then Wensuite v2.40b (at least in 256 color mode). I
don't know anything about Wensuite v3 though. I only know that lots of
French Atarians are looking forward to see/get the new release.
Have you ever used Wensuite v2.40b online? I did. I don't recall me the
details but it's was surely not worth the pain.

5930. 1998 Atari Times Awards

Newsgroup: comp.sys.atari.st
Date: 1998-09-13 00:00:00 UTC
From: Colin Polonowski <polonowski@zetnet.co.uk>
Message-ID: <6th4at$l3p$1@irk.zetnet.co.uk>
Source record: 93912

*** PLEASE SPREAD THIS BULLETIN FAR AND WIDE! ***

*** 1998 Atari Times Awards ***

What are they?

They are our attempt at repaying those people out there who still believe the Atari platform is a viable alternative to the PC dominated computer world.

Those people who spend time and money pushing the Atari platform to its limits and supporting it in any way they can...

Is this the first time?

No! The Atari Times Awards were launched in 1997 and proved to be surprisingly successful. This year we want to surpass this and make them extremely successful!!!

What categories are there?

Best Programmer
Best Commercial Release
Best Shareware Release
Best PD/Freeware Release
Best Game
Best Hardware Add-on
Best Company
Best Non-Profit Organisation
Best Disk Magazine
Best Paper Magazine
Best Web Page
Best Internet Service Provider
Special award for services to the Atari community

How do I vote?

Voting is easy, you have three options:

1) E-mail your nominations for each category to:

polonowski@zetnet.co.uk

2) Fill in the form provided on the Atari Times Homepage at:

http://www.users.zetnet.co.uk/polonowski/atimes/

3) Write your nominations on a piece of paper and send them to:

AT Awards 98, c/o Colin Polonowski, The Croft, Hope Rd, Nibley,
Nr Yate, Bristol, BS37 5JH, ENGLAND

That's all there is to it!

So, go on and show your support for the Atari platform by voting in the 1998 Atari Times Awards and show those Atari supporters out there that you have noticed the effort they are putting in!

Cheers,

* Colin Polonowski, polonowski@zetnet.co.uk
* The Zone - http://www.users.zetnet.co.uk/polonowski/
* Editor - Atari Times(UK), Programmer - Croft Soft Software

Hi Boris,

don't know what your problem is, but displaying size and date (time etc) is
NO problem at all.
Perhaps the old config files for 1.09 won't do the trick in 1.27, I recall
newer versions have a different way of saving all settings, but I'm not
sure from what version onwards.
Maybe you gotta set it up again and save prefs then. There is a separate
menu entry "Display: save display settings" but AFAIK these settings are
saved too when using the "Options: save config".

All I have right now is one wish for Thing: making the time after which a
directory opens up after dragging files onto it selectable (like in Jinnee).
That would be the finishing touch, ATM at least...

Hi Martin,

I recall the days you could buy ST-RAM boards or TT-RAM boards for the TT
from Atari... if my brains haven't dried up (hardly possible with all that
wine I'm feeding them) I remember TT RAM was far more expensive. I believe
upgrading to the maximum possible then (16 Mb) cost then around USD 3000,-...
Nowadays it's the other way around: hardly, if not at all, ST boards to
locate. ST RAM is for the happy few, it seems...

>I only have 4 Mb of ST-Ram, if my AixTT isn't fixed soon...

I've read about your problems with the card.... heck, maybe I'm gonna order
the same one. Just gave these AG-Comtech guys a yell at t-online, and the
msg wasn't bounced, so I expect some answer next week.

5934. net ".zip" files

Newsgroup: comp.sys.atari.st
Date: 1998-09-13 00:00:00 UTC
From: marksimp@-nO-sPaM-integrityonline7.com
Message-ID: <35fc232e.0@205.238.18.7>
Source record: 93916

I have tried in the past to decode ".zip" files (what pc's call zip, I suppose), that I downloaded off the net, using STZIP 2.6. I always seem to get the message "not a zip file, or damged zip file" when I try to decompress them. I do not have this problem with zip files from atari sites, or from the genie libraries, or from the BBS's I used to haunt.

Someone in this newsgroup recently told me that they don't have any problems with zip files from the net, so I'm wondering what I'm doing wrong. I downloaded the clinton files from yahoo friday, and have been unable to decompress the zip. Anyone have an idea as to why I have this difficulty?

Thanks in advance,

Mark Simpson

It's not the first time you complaint about bad transfer rates. You did
that for the Belgian site too, I think. I think that the problem is on
your side. I'm a very regular user of Erik's homepage. The download speeds has
always been excellent.

>Why is it that programs expect UFSL font selectors and if they don't find it
>they crash???

Euch, I don't get this. All the versions I've tested so far never asked me
for an UFSL fontselector and yet I can change the fonts on the fly.
AFAIK I don't have such a thing installed on my system.

Mymail is far from finished. It's still a betaversion.
The major problem I've is that Mymail won't work very good with the
mintnet/gluestik combo. Most of the time Mymail abort prematurely the
download if my mails. This is a problem you won't have when you work with
STing.

>
>Remains the news-part of Newsie (I replaced the FTP part already by A-FTP,

5937. Video I/O for falcon

Newsgroup: comp.sys.atari.st
Date: 1998-09-13 00:00:00 UTC
From: marksimp@-nO-sPaM-integrityonline7.com
Message-ID: <35fc250c.0@205.238.18.7>
Source record: 93919

Hi,

I need a way to get full screen video in and out of my falcon, so that I can manipulate/edit existing video, and get it back out to my editor.

The averkey would work good for getting the finished product out, but how do I get it in, without spending a fortune, if the equipment is still available at all for this? Titan's unit is a bit pricey, if they still make it at all that is. Are there any alternatives?

Thanks,

Mark Simpson

question
> ATM.

There is a small auto folder program called MAGXUFSL which you should be
able to find on one of the usual FTP sites. Just drop it into the folder
(and re-sort it if necessary) and your problems with such programs will
disappear. It causes the system font selector to be used by all UFSL-hungry
programs.

<snip2>

> systemfont without needing UFSL/XFSL.

If you haven't tried Okami yet then give it a whirl. You will also need POPwatch and NEWSwatch for mail and news transport with STinG. It's by far the best offline reader for the Atari IMHO. And you set the fonts using a text config file so no problems on that score! It has a few problems under MagiC PC so I'm no longer using it, but I do miss its user interface, and the possibility to use a decent editor (ie Everest).

I'd like to echo what Louis is saying here. If you haven't used it, you are missing out on one of the best things you can get for your Atari. Once you have had it on your system you will *not* want to do without it.

If you can stand the wait, you might be able to pick it up at a reduced price at the Atari show in November, I guess.

Try downloading the demo of CAB 2.7 at
http://www.members.aol.com/ashinfo/index.html. I found GEMjing was in
the MODULES folder.

Martin, 256 color mode I should run on the gfx card too... (TT-low is no
resolution at all, is it?) But I'll give it a try.
OTOH, running TC was OK, unless I had "images active".

Hell, from what I gathered Wensuite isn't even worth downloading a demo-beta.
I once looked at a very early (beta?) version on my set, and it didn't look
OK... I recall a bright orange/red display with some unreadable characters.
I stopped it rite there and never bothered about newer versions, especially
since CAB does a nice job over here.

Hi Martin,

nope at all. The belgian FTP site had problems because of my own stupid time-
out settings. After resetting these to more practical values it was no
problem at all.
Maybe it was because of the sunday morning/midday traffic, but Erik's site
was HARD to connect to at all, the URL got in bit by bit, next I tried to
transfer the update (500+ k), it came in around 300 cps with more pauses
than I've ever seen. I recall Rein Bakhuizen had the very same problem when
he tried to fetch Mymail 0.61 the first time, and that was for days after
days. He only got it after e-mailing Erik, whereupon Erik attached the file
to an e-mail to him. So Erik's link is not a fast one, that's the least I
can say. Flinny's site had no problems at all, 2 minutes later.

>>Why is it that programs expect UFSL font selectors and if they don't find

>AFAIK I don't have such a thing installed on my system.

Neither do I, to be honest: I grabbed such a thing afterwards, installed it
in MagiC and even then MyMail bombed out after selecting the font stuff.
Also happened running under TOS... BTW: MyMail then complains about old AES
versions, not being 3.30, and won't display much of the icons.
Another one is Graftool, my (registered) version even has the fontselection
option greyed out, but I recall from the first version it said "Need XFSL
selector installed". When I had this stuff installed today I tried again: No
go! You better manually edit Graftool.ini in the font lines... Well, maybe
it has to do with the presence of Liberty/Freedom, you know, those
"Schweineprogramme"....??? Also I've still got this Magic library running
(not the ASH one, but the Peter Hellinger one)... One thing, as a user you
simply have no idea whether or not they screw up your system...!

>
I know and realize that. To be honest, the font stuff is the only one I'm
complaining about, and if someone's able to tell me how to get it straight
into the config files, I'd be glad. As far as I've been working with Mymail,
it looked good enough for replacement of Newsie's e-mail part.

Under DISPLAY menu entry , you get the selection box with all the various display options including time date etc. I'm using it successfully, so unless you've got a bugged copy, it should work fine. I've got a registered version, but I don't think there are any restrictions as far as display is concerned.

Kind regards

You need the FPU 68882-20 PLCC for the Falcon.
Just press it in the right place. No software needed.
I only know of some CAD programs that take advance of the FPU.

Oh, ok. I was trying to avoid having to get HD Driver, but if that's the only
way, maybe I will have to.

So HD Driver isn't confused by the new Win98 FAT32 file system?

>spending money on stuff that isn't going to be compatable. Thanks in advance.

I don't know about the floppy, but as far as 19.2 bps. That is the fastest
the ST serial port will go (unmodified).

But, I used to (and occasionally still do) use Freeze Dried Terminal with a
program (serial patch) called FAST_SER.PRG. When you use it with a terminal
that only goes to 19.2 (ie. that's as high as you can select within the
program itself), a setting of 19.2 will actually give you 57,600. A setting
of 9,600 will give you 38,400. I ran FzTerm on my Falcon with my 28.8 modem
and port set at 57,600 for a long time (and in Falcon 16 color mode I might
add).

And, if you are interested in an excellent (but little known- I think) BBS
program for the Atari (freeware), check out Foresight BBS software. It's on
some of the ftp sites. If you can't find it, I can send it to you or tell you
where it is. This software was designed by one of the co-writers of Freeze
Dried Terminal (Brian Hauer - a very knowledgable Atari programmer) and is
very good.

Well, I omitted cache.dns (so STinG would regenerate another one) and set all
STX files to read only status just to try it. I'll let you know if the files
become corrupted again.

Actually, no, I'm not a "newbie". I've been using Atari's since the 8-bit
days (even programmed 'em). And I've had an STE since 1990, and my Falcon
since 1993. I've been on the internet for about 4 years (at first using a
shell account then StiK/SLIP, and now STinG/PPP). I'm fairly knowlegable
about Atari's in general, but some of the specifics about how the whole TCP/IP
thing works (not to mention the OVL) still baffle me. But that's ok, my
intentions are to USE the software as a tool. Not to learn how the tool
itself was made.

>>>1.3011 beta

>
>You've probably filled in some form, maybe a search entry at a search engine.
>Of course the text filled in must be posted to the engine, why is that so
>uncomprehensible for you ?

Actually, I had just started browsing a page. I was not filling out any
forms, or sending any e-mails. Just browsing. And the dialog box popped up
about 5 times in a row about every 2 minutes or so.

If I WERE filling out a form, or searching, I guess it would make more sense.
But I wasn't. Hence, the confusion.

And I never knew re-direction was a problem before. Kind of like it was
fixing something I didn't know was broken - even if it was.

It's like, I never heard anyone say "...that DAMN re-direction bug in CAB is
killing me, sure wish it was fixed". I never knew it was a problem. :^p

Mark - just downloaded the file you are talking about and checked it -
Zip is OK. Usually the problem with corrupted binary files is caused by
flow control problems with your communications software. If
you are not using Peter's Serial.CPX I would suggest that you do. Make
sure that you have RTS/CTS checked for the port you are using. Not
having flow control or software only can and will lead to bad downloads.
STZIP is not foregiving with corrupted files :).

OTOH I have had problems in the past with STinG and high download speeds
if the buffer in HSModem was set to low. I have mine set at 4096.

Regards,

Steve Hammond

I can't agree, here. I've been to Erik's page numerous and even
downloaded the latest version and it is usually very good.

>Anyway, I installed MyMail and sure it looks OK. Lotsa gimmicks and it even
>works here... Only thing is selection of other fonts gave me hell again. Why

I can't answer your question, but here with MagiC and WDialog
installed, MyMail's font selection works just fine.

Still, my recommendation is to go directly to Okami, with POPwatch and
NEWSwatch. Still the best IMO.

Hi Louis
Well, the only thing I can reconmend is .... (drum roll please..)
ASH Emailer :-)
I know you use MagiC, so you've already met the system requirements.
Emailer handles News, Email, all in a very slick easy to use gem environment (no
i dont work for ASH :-)
The only problem is the price. It IS commercial, but I do not regret spending
one penny on it.
The other draw back is that it uses Iconnect. So none of your Sting apps will
work. But I dont think you would even miss any of them unless you use IRC.
For iconnect you can use:
Teli for telnet (GEM environment, bubble gem support etc)
Emailer for News and Email
Fiffi For FTP
and of course CAB
So like I said, if you dont mind to pay some money, and ... dont mind a bit of
german (really though, you dont need to know any german to use this program,
everything has nice icons and its an ease to use :-)
anyways
Ive rambled on to much.

5962. Using a PC 720k floppy on an ST

Newsgroup: comp.sys.atari.st
Date: 1998-09-13 00:00:00 UTC
From: legacy6150@aol.com
Message-ID: <1998091301450600.VAA20269@ladder01.news.aol.com>
Source record: 93980

I've been hearing rumors that you can use a standard IBM 720k drive on an ST, and I wanted to confirm this before I go out and spend a few bucks on buying one and finding out it doesn't work. I've also heard that you can use a standard Hayes compatable external modem on the ST, but since none of the terminal programs support over 19.2, that's as fast as it'll go, can anyone confirm this too? The reason for all the questions is 'cause I wanna put my BBS back up on my ST and I wanna get all the facts straight before I go spending money on stuff that isn't going to be compatable. Thanks in advance.

Why was it you wanted only ST ram? You would probably have an easier search (and smaller bill) if you got one of the Atari 16 meg TT ram boards.

Paul,

It is possible if you use HD Driver on the ST. HD driver will
read the PC formatted cart on your ST, although there may be a
partition size limit depending on what version of TOS you are using.

actually, "Black Page Syndrome" happens with a particular version of
AtariWorks; not this one, though, as it's the original release that came
with my Falcon.

The thing is, though, that it prints perfectly under NVDI 4 when
running under either SingleTOS or under Geneva; it's when it runs under
MagiC 5, though, that I have it either it printing control characters
(under AW) or printing text but with red banding! (GEMvelope).

Looks like I'll have to use Geneva for printing.....

Yup: you can buy it from System Solutions in the UK. It's a good idea to
buy NVDI PC too as otherwise the graphics display is going to be very
limited (and slower).

> or there are a way to use normal tos images for this aplication..

Yes you can use TOS images, but only in standard resolutions. Instructions
are included with the package, as well as a utility for making a TOS image
from your existing Atari.

Broadly speaking, true, but I believe there are wrinkles you need to know about which I'm sure the hardware gurus in here can fill you in on (out of my league).

anyone
> confirm this too?

Yes indeed. The problem is the port hardware, not the programs. Hardly worth going for more than 14k4 as a result. However you might like to check out one of the serial port modifications (there is one called RSVE, there may be others), which will take it up to 38k. Modern comms programs (eg the Connect terminal package, STinG TCP/IP stack) will work with higher speeds directly if HSModem is installed, others can be made to use them as IIRC RSVE has some method of faking the new settings by remapping some of the slower speeds.

Looks like the driver itself is OK if it prints under other systems. Sounds
more like some data is getting lost/mangled between NVDI and the printer.
So, casting around in the dark and clutching at straws, have you tried
using the FPRN device? If not, it (and its instructions) are in your
NVDITOOLS folder. If you have installed the device, and NVDI is using it
(check the CPX), you could try *not* using it to see if it's affecting the
problem.

The only other thing that springs to mind is that there was a discussion
here quite a long time ago about problems with printing under MagiC on
Nemesised or Afterburnered Falcons (can't quite remember which). I never
had a Falcon, so I didn't pay it a huge amount of attention, but IIRC some
people were getting round it by using a print spooler.

> Looks like I'll have to use Geneva for printing.....

Hope some of the above will help you to avoid that scenario.

My $.02 worth....

As a musician/music teacher/computer nerd, I have been using computers since college and applying them to my music.

For the $$$ amount invested, my little Atari 1040st and Cubase score are the best. I think steinberg would probably have some copies. I got mine from them a couple of years ago, even got a new key.

I use a rack of 4 keyboards, mixed, and output to an amp. We rock the neighborhood :o)

As for memory, i never could get cubase to run on 1 meg. i upgraded the 1040 with a kit I got from toad. it was an easy upgrade and it used the old type memory, you know, the shorter ones, cheaper ones <grin>

i buy 1040's when i see them cheap, i have several here stashed away for the day that i power this one up and it rolls over and dies...

seeya!

Dan,

It may not be helpful, but I have used exactly that setup -- MagiC
5, NVDI 4, Atariworks, Deskjet - with no problems on my stock Falcon.
Have you checked other auto programs that might cause problems under
Magic but not under TOS or Geneva? Have you tried different versions
of the HP drivers? That shouldn't really be the problem, but I've
seen stranger things. Does the problem only occur with Works or all
GDOS programs?

That's not many votes, and that's also on a MagiC support page ;)

I use MagiC and I think it's instable as hell, wouldn't vote for it anyway.

> Cubase.
>

Here's what I would do:

Find Cubase first, since it's pretty difficult to get a 2nd hand copy
with a dongle these days. It will still run in 1Mb, but you'll have a
few options disabled (scoring, mixermaps...).

Then, get an STE. An old 520STE will cost less than an upgrade board for
the STF, and you can boost it to 4Mb for next to nothing. Keep the STF
to use it as a backup machine or for gigs.

You'll also need a mono monitor for Cubase.

Cheers,
Nick

> -Bill-

Get Expand from Softjee. It is a sample player expander program, that
can even run along with Cubase. You can use your own samples, but it
doesn't record them. You can use it with Studio Son or some other sample
processing program for recording and effects.

there's no point in using a TOS image, because this isn't really an
emulator. It's a replacement OS, that's been adapted for the PC.

If you want pure emulation, try TosBox or PaCifiST.

KDE isn't an operating system, it's a GUI and a set of applications which run on top of unix/X11 (rather like OpenLook or CDE). It is extremely nice, and I would expect it to run just fine on a TT under NetBSD or linux. (My TT currently runs NetBSD/X11/fvwm2, and I don't think KDE requires any more resources than fvwm2).

Well, actually I had the same suggestion from others too... So at least I'll
give these a try too.

I must say, MyMail isn't bad at all... tho' all those icons are a bit
confusing picking the right one to do what you want it to do :-), but I
figure I need some time converting to it. OTOH, it IS a bit unstable on my
set, probably because I use MagiC.
Things I'd like to see changed is the Bubblehelp: now it works by parking
the mouse over there, after 2 secs you'll get the info (and I DO need that
feature many times right now). It would be nicer to have the "mouse right-
click feature" doing it, especially because the icons only "work" when the
Bubblestuff isn't popping up. But that's up to Erik.

For a beta it ain't bad...

>
Paul (and others),

the MAJOR reason I'm looking for replacement of Newsie IS the possibility of Newsie screwing my files, although it SEEMS like it hasn't happened for quite some time.
This discussion is already several months old but came to life again just recently, and I do believe Peter (I never did not believe him on that part!)

I consider Newsie a fine program otherwise. News handling/E-mail/FTP packed together in one program, nice going. The slight bug of not writing the precise numbers of fetched message-numbers into the Default.grp is something I can live with.
Then there's the window-settings bug: the very strange thing is, this doesn't show up in my regular resolution of 832x624 24 bit, but when I work TT-med on a VGA monitor it doesn't work right: windows half-sized etc. etc. I can't explain that, but those are the facts here.

Another one was upon transferring files to my own homepage it wouldn't display the directory again and time out eventually. So if I have to transfer 3 files to my homepage I need to start up Newsie 3 times... This appears not to be Newsies bug, it happens also with AFTP, wherease AFTP doesn't time out at all but simply stays where it is and I need MagiC's taskmanager to kick it out. So it may be a problem with my ISP.
Working with A-FTP I must say it works nice otherwise, slightly faster than Newsie and the handling of going into different dirs is more convenient. I haven't seen anything other than betas.

For E-mail I'm experimenting now with MyMail, and it works OK, tho' a bit unstable under MagiC. OK, it's a beta too and right now I'm only up to v. 0.64, whereas 0.68 is out already. Only problem there is I can't change the fonts and I still don't know how this info is editable in the config files.

I had several suggestions from others to try out Okami/Newswatch/Popwatch, so it looks like I need some more short Sundays to give these a try.

Let me put this straight: as soon as John has found/eliminated the corruption bug in Newsie I'd go back to it; and I'm still using it for

newsgroups, but this corruption thing scares me, really!

Hi Pat (& Anna),

well, maybe it's because I hook up from Holland... more people over here
have exactly the same problem.

>>Anyway, I installed MyMail and sure it looks OK. Lotsa gimmicks and it even
>>works here... Only thing is selection of other fonts gave me hell again. Why
>>is it that programs expect UFSL font selectors and if they don't find it
>>they crash???
>
>I can't answer your question, but here with MagiC and WDialog
>installed, MyMail's font selection works just fine.

I had some answers saying MyMail is a bit unstable under MagiC and right
here that's exactly what it is. Just 10 minutes ago I had it sitting "idle"
under MagiC while reading in Newsie and Newsie crashed 3 times in a row.
Disabled MyMail and problem gone... The font selection won't work running
from TOS either. Click the "font menu item" and C-R-A-S-H!, just gone.
Like I said, it might originate from the use of those Liberty/Magic
libraries, I'm just guessing here, so that needs some time to find out as
well. I could do without running the Magic library, but Liberty is needed
for Freedom, and that's one I'm not giving up easily...

About those fontselectors: I have had problems with several programs
crashing while trying to change fonts: LED (a FIDO newsreader/editor) never
accepted the "menu entry change font". I forgot how I managed to get the
right fonts set in LED, but one time I managed. Then Graftool: same stuff,
it said "No XFSL font selector installed". Recently I changed the ini file
and set the font to what I want it to be. No problems.
QED (at least the older versions) would let me select different fonts and
save these in the configs, but at the same time the standard font in the AES
as set thru' MagiC's config would change to another one... Can U explain
that? Haven't checked it with 4.51 yet, but I wouldn't be surprised if it
happened again. Well, maybe my TT has something against changing fonts...
OTOH: selecting different fonts in Papillon, Smurf, Autocad, Photoline, CAB,
Newsie, Frac-IRC, TVT102, and numerous other programs is no problem at all.

So what's the problem then???? You tell me, please.

>Still, my recommendation is to go directly to Okami, with POPwatch and
>NEWSwatch. Still the best IMO.

You're nr. 3 suggesting that. Keep it in my mind.

>Pat & Anna

>
>This evidence against, is *very* weak.

Peter,

to be honest: I'm glad this discussion has come to life again. From what I
read from Ronald's message, I thought he suggested that Thing was corrupting
Newsie's default.grp file. I still don't think so.

The other way around: yes. This time Newsie really screws around at random.

>I'd be glad if the bug were fixed, but I'm not as sure it is. This bug, as
>explained above, has the potential of hiding itself very effectively, by
>corrupting apparently unrelated files. It is well possible that it is now
>corrupting some other file which you only haven't viewed for a while.
>
>
Well, as you've read by now, I'm seriously looking for replacement of
Newsies features. And again, as soon as the bug HAS BEEN eliminated, I'll
probably go back to it. It has been on my C:\ (...!...) for around 6 months
now and it has around 1.5 Gb available on data to mess around with, and
sofar it hasn't done any harm but then again, I didn't check each and every
file here...

CU NeXT msg,

```

>and of course CAB

Hi Pacman,

well, I must say I had several tries with I-Connect and the only time I was
able to hook up with it was with an early version. Emailer won't work with
that one though, and the newer version wouldn't do the trick (Yes, I've
sorted this out already some time ago).
Maybe the same problem as with this Draconis stuff: I can only get a decent
PPP link from TOS, not from MagiC. But I'm not giving up on MagiC, so I
forgot about I-Connect and therefore about Emailer too.
But tks for the suggestion just the same.

Try megafli.exe in DOS mode to segment the large audio file into smaller
parts for transfer to high-density floppies. Then bring the floppies over
to your Falcon and run megafli.ttp to rebuild the original file. To keep
the number of floppies needed to a minimum, compress the audio file first
before segmenting. Because MegaFli has DOS and TOS executables, you can
swap audio files in either direction... no cable or special disk driver
is required.

The latest version has many bugfixes so if you have a old version do a try
with the new version.
If you can't download from my homepage do try to download v0.67 from
ftp.funet.fi
I will upload the latest version on funet later this week.
Or drop me a mail on erikhall@tripnet.se and i will mail it to you.

>About those fontselectors: I have had problems with several programs
>crashing while trying to change fonts: LED (a FIDO newsreader/editor) never
>accepted the "menu entry change font". I forgot how I managed to get the
>right fonts set in LED, but one time I managed. Then Graftool: same stuff,
> ......

>So what's the problem then???? You tell me, please.

The font selector in MyMAIL is unstable and is not finnished.
There is more than the fontselector that is unstable but
remember that it is a beta test version and it is impossible for me
to do it stable directly.
If you find any problem please do send me a mail
and i will try to solve the problem.
All coding and testing of MyMAIL is done on my free time
and the progress in geting it more stable depends on you on the net.

Hi

I'm after two cover disks from the Amiga & ST Format magazine, the mag before they split; issue 2 & 4.

Either the physical disks, or sent via email.

If sending by email, can you please send it to this address - AtariST@usa.net - this will allow me to collect it via my Atari. Please let me know via emial that you have sent it so I can go and fetch.

Thanks, in advance

there is a program called audiocreate wich is a midi sampler that works on
ste and falcon but it's in french. despite the language barrier it is actualy
quite usable. i got my copy at one of the french (or was it german) sites but
i cant remember which one, sorry --- citizen_smith@hotmail.com

Hi!

Nicholas Bales <bales@mygale.REMOVETHIS.org> wrote:
> there's no point in using a TOS image, because this isn't really an
> emulator. It's a replacement OS, that's been adapted for the PC.

You're wrong. MagiC PC /is/ an emulator, and you /can/ use TOS images.
Simply copy a tos.img into MagiC PC's folder and rename it to rom.os

> If you want pure emulation, try TosBox or PaCifiST.

PaCifiST is the coice if you want almost full hardware emulation, e.g.
to run games (which doesn't mean some hardware dependent games won't run
on MPC). TosBox's hardware emulation doesn't come close to MPC's - but
according to the author, that's not the main purpose of TosBox, anyway.

One point of course is that both TosBox and PaCifiST don't cost that
much money (if at all). It's up to you to judge if you need the extra
speed and the extra possibilites (like custom resolutions, no memory
limitation and Falcon-Sound-XBIOS emulation in MagiC mode) for the extra
money, which is even more because you really need NVDI PC (or NVDI 5)
for decent screen display speed - but this problem also affects TosBox,
IIRC.

Ciao

Thomas

Nurmix <ecncomr@socal.com> wrote:
> Is it possible for a PC (Win98) to read an Syquest EZ135 from an Atari (or the
> other way around)?

Get HD-Driver (atleast v7.12) and partition the disks with the
"TOS+DOS"-option. Because of the different partition-schemes on TOS
and DOS you can only have one partition on the disks, but that's a
small price to pay for a format that can be read and written by TOS,
MagiC, MiNT, DOS, Win95/98/NT and Macs :-)

If you get the latest MiNT-version (1.15, should be released any day
now) you can even read and write VFAT- and FAT32-partitions. It also
supports MagiC-style symlinks on TOS/DOS/VFAT-partitions.

which
Oh yes. But the OS I meant sounds AFAIR similar.

(downloading and searching the index of c't)

It's name is KBS by Roger Butenuth (and AFAIR two other students), a
former
school colleague of mine (maybe that's the only reason, why I still can
remember anything at all ;-). The leading German computer journal c't
published two articles about it (part one published in issue 2/93 page
146,
part two in 3/93 page 222).

PS: But I don't know for sure, whether it is really a OS with a GUI or
just
commandline oriented.

>what you want.

I added the extra resolutions into the CDD with a text editor (the utility
prog that's supposed to generate the CDD seems to have one or two problems),
I had some limited success with the result but had the banding problem that
I mentioned originally.

>I could email you the drivers I was referring to if you would like.

Thanks, but I'm OK now (and in fact I found that I had the driver all along
on another partition!).

I'm going to quiz the UK distributor about the driver generator prog at the
next show in November.

I've thought that too. However, probably be better to put it in as a
General Option - have it delete automatically unless you tell it
otherwise, or tell it to query you on your exit. Those log files can
get huge pretty fast :)

Ok, I wasn't aware of this.

However, I had the idea that the whole point of MagiCPC was to have a
TOS compatible multitasking environment, not pure emulation.

As you say, for pure hardware emulation, there are cheaper/better ways.

Cheers,
Nick

I'll have to try the AUTO Folder idea.

I do have NVDI 4.12 so I'm currently running the latest English
release (I went and did it the hard way - went to England and got it
from Systems Solutions :)).

hmmm. I remember that there were problems under Calamus SL when
running in high speed mode but I never had that problem when running my
GDOS/NVDI programs at high speed. I know that Titan/BSS came up with a
patch program that runs in the AUTO folder.....I'll have to try that.

I'll probably keep Geneva for doing testing of software when I
write reviews, so it's not a hardship (and besides, Geneva has served
me well for years so I'm kind of attached to it).

6022. Falcon030 to 14 Mb upgrade

Newsgroup: comp.sys.atari.st
Date: 1998-09-14 00:00:00 UTC
From: atarist@xs4all.nl
Message-ID: <6tja3fop1@news2.xs4all.nl>
Source record: 93793

Several peolpe have contacted me asking for the cards I have here.

Searching in the old boxes I find 50 of them.

The product is:

ATIN Electronics MF-030 Memoryboard 1/4/16 Mb
with 4 connectors for SIMMs
It plug in like the old 1/4 Mb Atari falocn memory card
The same connectors are used.
We know that not all kinds of SIMM modules work on this card so:
it really is "plug and pray".
The manual is in Dutch but it is so simple that this will be no
problem. There are only 2 jumpers to set and these are indicated for
their function. (chose 1/4/14)

The Stichting ST as a non-profit organisation sells them worldwide
for the cost of production. The real hardware cost I mean.
I do not know what comparable boards cost, but maybe ?30 is alright?

Send me an e-mail with your postal adres:if you want one i send one
by airmail.

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

6030. Degas and fonts

Newsgroup: comp.sys.atari.st
Date: 1998-09-14 00:00:00 UTC
From: dlormand@aztec.asu.edu
Message-ID: <6tjn24$3r8$1@news.asu.edu>
Source record: 93851

Hi, all,
I've got a long-term project: a video titler system wherein picture files can be loaded and displayed via the composite output of a stock ST to a video projector. Tony Greenwood has provided me with an excellent display program he has written (public thanks, Tony!) that accepts the Degas .PC1/2 files I specified and sequences them under full manual or automatic control with several transition effects.

Now I'm facing a shortcoming of Degas. The attractive feature of this titler projection system is having "slides" with text in various colors, sizes, and typefaces. Degas is one of the earliest GDOS programs, so I have a lot of choices of bitmap fonts - but only up to ten at a time! I can have 20 or 30 fonts in ASSIGN.SYS, but Degas takes the first ten. There is no scrolling selection dialog. If I want to use a font that is not in the top ten, I have to edit ASSIGN.SYS and reboot. Ick!

So the question is, Degas is a bit old; is there an art package that provides everything that Degas does (including save as .PCx and .PIx) and more, and allows selection of any bitmap or scalable font available in the system? Again, since the output is destined to come out in composite, all the work is done in ST-low and medium resolutions.

A related question is, given that SpeedoGDOS and modern NVDIs are supposed to be drop-in replacements for standard bitmap GDOS, do programs such as Degas, which were based on early GDOS, accept scalable fonts?

>dangerous. I would not be surprised if people who suffered from this bug have
>dozens of corrupted files on their hard disk, only undiscovered since the
>files have not been accessed lately.

I have experienced the problem with several versions of Newsie
including 0.90. The last time this happened it corrupted the whole
partition that held the Newsie mail and newsgroup folders. I was able
to repair the damage, but as Peter indicates, some older files may
well be corrupted and I just haven't gotten around to checking them.
Every once and a while I'll go searching for some old document that I
saved once, only to find that it is no longer readable.

This last time, I had to wipe and restore my whole F:/ partition, so I
took the opportunity to change it into two partions, with the new G:/
being just for Newsie (program and download files). Now I see posts
about how it can sometimes corrupt some of Sting's data files, or as
Peter points out, any file on any partition. ARRGH!

Use Cyberpaint. You can also use DPaint. DPaint is probably the best
paint program ever made for the ST, plus you can create your own
Fonts. Hyperpaint2 is also a pretty good program. Most of the ST
picture formats can be converted to another without a loss of picture
quality. The exception is Spectrum pictures and Photochrome pictures
because the have more than 16 colors.

Ah, that explains it... any way of manually editting something in the config files? Haven't seen any line containing font info but it could be that without such a line it takes the systemfont?

I realize it's a beta and don't expect a perfect working program for zero bucks.. You'll most certainly hear more from me. Like I said: it sure looks good and has some nice options and I do need a replacement for Newsie. I've got Okami/Newswatch/Popwatch in the meantime, but as far as I can see, setting up Okami isn't done in 2 minutes (good lawd, I just quickly looked into this O.INF, I'll need at least one short Sunday for that one alone).

Popwatch/Newswatch are up and running already and especially Popwatch is a nice program to have next to your emailer (although it doesn't support Mymail yet, I think).

Hi,
You can use any PC-drive - even 1.44MB drives (though they'll still work only as 720kB) - which have a jumper for setting it to Drive Select 0 or 1. PC-drives are always set to DS1 from the start and you have to change it to DS0. Many drives can't be changed, so check out if the drive has a jumper for DS0/DS1.
The next thing to do is to turn the flat cable around, so that the cable seems to be inserted the wrong way.
Then it should be ok.

Best regards,
Claes

I can't say that for sure because I don't use Win98, but I remember reading that Win98 gets its main space savings by using a smaller sector size. I doubt that would fool anything designed to deal with hard drives on the ST, since we already do that. I would also assume that Win98 must be able to recognize hard drives formatted for Win95, otherwise Win98 would be a total disaster. Uwe Seimat would have to give you final confirmation though.

Good morning!

Once again a special offer: ATARI ST traditional package

*** ATARI 1040STfm / 1MB RAM / German TOS 1.02

+ CPU halt switch (very suitable for action games)
including built-in RF modulator for easy TV connect in color
resolutions, original ATARI mouse, manual and power cord

ATARI SM124 monochrome monitor 71 Hz
(with "Euro" power cord plug)

Software bonus pack: Word Perfect for ATARI (text processing)
Deluxe Paint (color painting)
Mission Genocide (color action game)
Plotting (" " ")

for only DM 180 (~ 90 EURO)
====== (or equivalent in any EC currency)

+ package and shipping from Germany

6045. Re: Draconis package

Newsgroup: comp.sys.atari.st
Date: 1998-09-14 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <905813389.8276.0.spot.c3adfca1@news.demon.nl>
Source record: 93866

Hi again,

OK, just for the record and before the authors send out their lawyers, I did try just another run from TOS, on the card and in (only) 256 colors.

Surprise, surprise, as said before, from TOS Draconis hooks up on a PPP link. Adamas (the browser) loads (NOW the icons look what they should look like) and loads HTM files from disk, NOT from the net. Images enabled displays images decently. Loading time looks OK, faster than CAB.
But, I repeat that: from disk. It bluntly refuses to load any http:// page from the net.

Finally tried Marathon (the E-mail client): this time it loads (meaning it can't stand 24 bit TC, maybe even it won't stand 15 bit...)
I couldn't get mails retrieved from my system, it WILL show new mail, but retrieving/deleting is out of the question.

So for a 10-minute evaluation copy of the whole package I'd say: go screw someone else, authors (don't have a clue who they are/where they're from).

Heck, I downloaded 500+ k just for nothing: TCP/IP stack (Draconis) only works from TOS, not from MagiC, but it will run on a 24 bit screen rez system.

The browser can't handle more than 256 colors, won't load from the net, only from disk, and finally the e-mail client doesn't do much more than telling you there IS e-mail, but fetching it.... no way!

OK, I'm announcing a Super Duper program supporting javascript for browsing facilities, the only slight drawback is it won't work. Fetch the 1.5 Mb package from my homepage please...

OK, fine, this concludes the test results from the Dutch jury.... Thank you very much.

BTW: one of the editors of a Dutch Atari magazine just e-mailed me about writing a piece on Draconis/etc. I told him it will be a short article: "of no use at all" :-)

: from the net.

Well, I'm not an Adamas expert either, just tried it out a few times. All I can say is, I didn't have as much trouble as you. It may be because I have a more standard set-up (i.e. no graphics card with drivers etc...). But then a gain, I know the outhor of the program did not ahve a Falcon to try it on, because he was very interested in the results of my TC tests.

For me, Adamas has worked perfectly in Falcon True Color mode (i.e. 15-bit), both under the standard TOS and under Geneva. I have also been reasonable consistently successful in connecting using the Draconis stack and downloading pages over the web into Adamas. There are some aspects of Adamas that I felt were nicer than similar features in CAB, but overall I prefer CAB.

I have not tested Marathon Mail very much at all. I tried an earlier version under 16 and 256 color modes and the interface worked fine. By that point in the history of the release of the Draconis betas the Draconis dial-up had a ten minute limit in the evaluation version and I did not use that time to test Marathon Mail online. Also, at that time there was a warning in the documentation that it was not TC ready, so I did not test it that way.

>Or drop me a mail on erikhall@tripnet.se and i will mail it to you.

Hej Erik,

well, it must be something.... I haven't got a clue what: the ftp.funet.fi server is terrible too... before I have a dir it takes half a bottle of wine (this becomes my new standard of time, after getting used to the Euro currency...), then I had to sort out the dir, appearently it is /pub/atari/Newitems/mymail.zip, but it took about 5 minutes (old time-measurement standards) before I got that one, then I simply clicked "get mymail.zip" but no go at all.

Before someone shouts "check your settings, Louis!" I'd like to add that 1 minute later transfers from rand.thn.htu.se went without any problem at all!

Oh yeah, of course I tried on your homepage again: it loaded pretty fast, then when I clicked the "program only" item for Mymail, after 9 kB CAB gave me a connection error, started again, after again 9 kB I got another connection error and then it quit. Fetched another file from another site 3 minutes later, no problem. So, what's up???

I recall having used funet.fi before without any problems, tho'...

Oh yeah, another thing: I tried with both Newsie and A-FTP: no difference.

"Yup, Louis, you're drunk again!" Hell no, had a few glasses, maybe I'm loaded, but drunk? NO!

Someone in Suomi/Sverige must have set up a filter against me :-) Like: if $Louis tries to get $Mymail, give him hell!. Who IS behind this? Not John Rojewski, are you???

:-)

Take the time to install Okami -- you won't regret the effort. The o.inf file may seem daunting but it reflects the power of this program. In one 'shot', albeit a little daunting, you can have e-mail and newsgroups in what is essentially a bullet-proof environment. But one can't appreciate Okami until it's configured and filled with mail and articles, otherwise many of its functions and nuances can't be seen or felt. At first glance the program seems austere, but underneath that 'look' is pure functionality.

Yep, from a reliable source he did that one. He also tried to get it to
work with TT Ram, so it would work better with the AB040 but the beta
didn't work.

Redirection isn't in CAB.OVL for long, so it was never a problem because it
wasn't there.

It does precisely that. Result is good enough so that most people just do
not notice there is Javascript at all, if the page does not rely very
heavily on JS. It's only the latter that makes those people pop up here
and ask for implementation. And you can't make those pages work without
going all the way - implementing JS.

Yes, I think it's a problem on the ISP side: something like the "PASSIVE
Mode" instead of "I_don't_know Mode"(don't ask me more about this). I do
have the same problem with aFTP and use Fiffi instead to access to my
own folders (for the web site). It's usually not a problem on anonymous
ftp servers.

I think John fixed this in the later version of NEWSie.

Since the Lynx is built for battery-powered operation, I suspect it handles under-voltage conditions rather well, and would come to no harm.

That said, it might pull more milliamps from an adapter running in 6V mode, which if close to the spec needed for the Lynx, might lead to overheating of the supply.

Unless the backlight needs higher voltage, I cannot think of anything internal to the Lynx that should need more than 5 volts anyway.

You could use the MiNT kernel without the AES 4.1 using oldgem.prg and
then i think it would be useable. The fact of using oldgem.prg let you use
the full MiNT features (XFS, XIF ...) whithout multitasking AES.

I 'll going to compile the new pilot link vesion this week using gcc 2.8.1.
I'll make a post in the group when it would be done.

best regards
Rodolphe

There is a patched version of MonST and Black Scorpions debugger works
with a 040 as well.

Hello,

I would like to connect my Atari 1040 STf to my engineering school's Web
which is an internal Web and is also connected to the Internet. Is it
possible ? If yes, which soft and wire have I got to use ?

Thank you for your answer.

And these would be pirated software, isn't that illegal??????
This is something I'd expect from Amiga owners. Amiga owners would prefer to
pay 3.50 per disk for pirated software than pay 2 pounds for the
original!!!!!!!!

6066. Atari St Games

I have 40 or so Atari ST games (boxed or jewel cased) on disc + lots of cover disks from ST Format which l want to sell at modest prices, due to the fact that my Atari ST is no more, deceased, an ex-Atari ST.
E-mail me for list/prices or will swap for PC-CD ROM software (particularly interested in strategy titles such as capitalism, Age of Empires, Fragile Allegiance, etc). Pax vobiscum.

AFAIK, there are three ways to capture video with a Falcon.

1). Video Master Falcon: Gray scale video only. Full color stills. Video format not compatible with any editor. You must save each frame out and convert it to a usable format. Inexpensive. External.

2) Matrix ScreenEye: NTSC/PAL compatible. Can do full screen capture at about 3.5fps on a standard Falcon. A 40Mhz 040 Falcon with fast ram will boost this to about 12fps. (Tip, run your VCR at 1/2 speed to get approx 24fps capture. Full capture rate at reduced frame sizes. VG quality. Works with Apexmedia and Falcon Tripod and also has it's own editing software. About ~225.00 USD used would be a good price. Check the Maus net for second hand units. Internal. Software control.

3). Expose: About the same as above, slightly better quality with a slightly slower frame rate. Y/C compatible. Has external NTSC/PAL decoder and manual control ("Splitter"). Gool luck getting an NTSC unit. PAL unit available second had. Going rate is ~$300.00 USD. Best used with PAL video input (ie, Aiwa digital converter system vcr in the U.S.).

>prefer CAB.

Well like Louis said, Adamas doesn't like running in true color mode at
all. At least not with my graphic card (ET 6000). As soons as Adamas loads
pictures, crash.

IMHO Adamas doesn't support true color. What I see before Adamas crashes
supports my conclusion. I get the same bad results when I try to load a
color picture into Image Copy with the screen display set to "Atari"
instead of a graphic card mode.

On 256 color mode there were less problems. I could load pages with
pictures from the Net. Adamas only crashed when I tried to view my
webcounter.

Hey Louis, believe what this wise man says. It's really worth the trouble.
Sure it doesn't look so pretty like Mymail but it's very functional indeed
and above all it's programmed by a fellow countryman of you.

I do like Mymail, it contains lots of very usefull things but as long as
it doesn't work properly with mintnet/gluestik it's of no use for me.

> Hi There
>
> Does anyone have any info about what printer drivers/fonts are available
> for Calligrapher Pro ?

The fonts were proprietary, so unless you can find someone who sells them I think you might have difficulty getting any now. Might be worth trying the company that sold it as I have a vague recollection that they were continuing selling some fonts etc even after discontinuing the program. Mind you, they were expensive.

As for printer drivers, I think it actually used GDOS 1 drivers though it kept them in its own drivers directory (IIRC I swapped the Canon BJ10 driver for another one which gave better quality output). I think this was a legacy from when it used to be a proper GDOS program. It might be worth a trawl around the FTP sites or PDL catalogues to see what's available and then try them out. I doubt if later GDOS drivers will work, though you could try FontGDOS drivers and see, I suppose.

Sorry if this is a little hazy, but it's a *long* time since I used the program having switched to Papyrus when it became available.

> program? I've got Microsoft Works and Office and Palm Pilot's database
> programs.

Depends on what export/output options you have with that program. If it will export some kind of delimited ASCII file you are home dry. Most common sort is CSV = comma separated variable, but tab delimited should work OK too: if you have Access, check your Access manual/help for info in importing text files as it's quite flexible about delimiters etc. You might find a setting which will import something Cardfile can export without too much work.

Failing that you might be able to mimic the process by outputting a suitable report of the data in ASCII and if necessary using search/replace in a text editor for final massaging of the data before importing it into your target package.

All this will only get the data into a table in the target package: you'll probably have to design at least one form to mimic how the data looked in your original.

This reminds me to the problems I had a few weeks ago. Some sites like the
Belgian ftp-site were very slow but it turned out that the culprit was my
ISP. They were switching over from Belgacom to Telenet and this was
causing problems. Now the most problems are solved and I doesn't have any
troubles anymore to get a decent download/upload speeds from for instance
ftp.funet.fi or Erik's homepage.

>Oh yeah, of course I tried on your homepage again: it loaded pretty fast,

What were you using to reach his homepage? Newsie or Cab? I always use Cab
in combination with a ftp proxy server for Erik's homepage. Downlaod
speeds 3.000 bps (with a 33.6 modem)

6076. Thing 127 with Geneva

Newsgroup: comp.sys.atari.st
Date: 1998-09-15 00:00:00 UTC
From: flipflap4851@my-dejanews.com
Message-ID: <6tmh7inrm1@nnrp1.dejanews.com>
Source record: 93814

When I try to use Thing127E with Geneva I can't get Thing to Multitask properly. Upon starting an application from the desktop, the entry for THING in Geneva's active applications list changes to THINGRUN. At this point I have no access to the desktop until I quit the currently running application. At this point the entry THINGRUN changes back to THING. As per instruction in the Atari Computing issue #8 review of Thing, I added a setenv path to Thing to GEM.CNF. This didn't help either. I can't find any reference in the Thing docs to running with Geneva, or even any description as to what THINGRUN is for. I am using a TT030. Is anyone successfully using Thing127E with Geneva?

Hi Martin,

well, actually I only used Newsie as "browser" just to see what it's like,
but normally I use CAB only. Cab's configured now to use A-FTP for fpt
stuff, before that was Newsie.

But. like I said, it was strange that I tried several times to hook up to
Erik's homepage, different times too, and you could see already on how
fast/slow/broken the data poured in it was a bad link. Trying to get the
archives was even worse. I hooked up to Flinny's site only 1 minute later
and it reached around max speed.
Same for the FTP: connecting to funet.fi was terrible, I had to sort out all
the dirs before I got to mymail.zip, then it even wouldn't start D/L. So I
went to Chalmers Sweden 2 minutes later and the link was max speed again.
You've read by now that this morning at 07.30 I could link to Erik's
homepage and fetch the file with no trouble at all...

And 0.68 is a lot better than 0.64, though I haven't been playing around
much with it yet, mostly because of lack of time.

Martin,

I noticed that, never knew Jos was Okami's author. I figure right now it
will maybe take me a week at least to set it up. This one really needs
reading the docs first, then setting it up and try it out. Meanwhile Newsie
still has to do my news stuff.

I'm just wondering, could I use the Draconis TCP/IP stack for connections
with Newsie and CAB? Something else to try out in my free time. I forgot
already completely about Adamas and Marathon. Then there's MyMail to test
further, plus Pop/Newswatch. At least for some time I won't have to ask
myself "what am I gonna do in my free time?"...

I have been reading all this praise for Okami, but so far I have not
seen how to get it !

Can it be downloaded, if so from where ? (And are POPwatch and NEWSwatch
essential for it to run, or just useful additions ?)

Thanks in advance for the replies

Paul

6085. Okami set-up

Newsgroup: comp.sys.atari.st
Date: 1998-09-15 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <905890936.9551.0.rover.c3adfca1@news.demon.nl>
Source record: 93823

Yessir, unca Lewey has his first questions about Okami...

After reading the docs/hyp at quick glance for the first info, I noticed that Okami sets up newsgroups in a dir structure like COMP/SYS/ATARI/ST/xxxx where xxxx would be the article number for a certain message in comp.sys.atari.st

I think I've got a major problem here: I still run on a basic TOS 8+3 filesystem and to be honest, I'm not gonna change that. At least, not for Okami. A few reasons: I need to repartition my HD (from what I gathered), second one is D-Edge can't handle it...
It would mean I can't subscribe to a newsgroup like 3dfx.oem.products.hercules.stingray128-3d or am I wrong here?

Furthermore, from what I gathered from the docs too, since I'm running on a TCP/IP stack, I would need at least NOS.TTP, or would that be a complete NOS package? Don't know nothing about this stuff, so I'm just guessing here...

The answer to the first question probably is the deciding factor whether or not I continue setting up Okami...

Paul,

go to http://www.xs4all.nl/~josdb/okami.html and C for yourself

I don't think News- and Popwatch are needed, but they're very usefull
anyway. Already like the option in Popwatch to auto-remove/reject unwanted
mail. Plus very simple to set up.

These, plus A-FTP (question from another reader) can be fetched from
http://www.flinny.demon.co.uk/download.html

What do you think externals clocks do?? They put the clock on DSP port pin number 26 directly (or with a little logical switch for Bi-clock) ...

You can also put 24,5760 Mhz oscillators for 48Khz BUT in fact both 22,5792 AND 24,5760Mhz oscillators are VERY hard to find! (if you have some please email me!!!)

There's a freeware program available that will convert CardFile 4 data
files for use with the Microsoft Windows 3.1 Cardfile utility.

Configure both POPwatch and NEWSwatch's retrieval formats to NOS, and
point them to your Okami folders (e.g. 'mail' and 'news').

Not quite correct: COMP/SYS/ATARI/ST.DBF where ST.DBF is the file
containing *all* the articles in the group. The other files in there are
index files etc.

> I think I've got a major problem here: I still run on a basic TOS 8+3

> 3dfx.oem.products.hercules.stingray128-3d or am I wrong here?

This seems to be OS dependent. Okami understands 8+3 filesystems but used
to get a little confused by MagiC, IIRC. For details, try a Deja News
search: there was a discussion in here not that long ago. Not sure if this
is still a problem. It never used to bother me but that may have been
because I didn't subscribe to any groups with problematic names.

> Furthermore, from what I gathered from the docs too, since I'm running on
a

NOS
> package? Don't know nothing about this stuff, so I'm just guessing
here...

Nope: use NEWSwatch and POPwatch (with STinG, obviously) configured for NOS
format up/downloads and you can forget about NOS.

They are if you want to read anything! Okami itself is an *offline* reader
which can import/export to/from various standard formats for transport. It
doesn't have any means of connecting to servers and downloading/uploading
built in.

Easiest format for a full TCP/IP connection (as opposed to a shell account)
is NOS format, for which you can use either NOS itself (hard work if you
already have a working STinG connection) or POPwatch/NEWSwatch for mail and
news respectively.

> These, plus A-FTP (question from another reader) can be fetched from
> http://www.flinny.demon.co.uk/download.html

The latest versions of POPwatch and NEWSwatch are available at the web page
of the author (Gary Priest):

http://www.the-gap.demon.co.uk/

The versions on the STiK download page are generally a little behind the
times.

From: Ken Kosut <kjcat@execpc.com>
Message-ID: <6tnbqv$rj5@newsops.execpc.com>
Source record: 93835

Greetings,

I wish to connect a SyQuest 200 MB C Removable Hard Drive
to a Falcon 030.

I have an 80 meg internal on the Falcon now.

Using HDX to format the SyQuest, (It should prompt me for an
ACSI or SCSI drive) Do I set the id on the SyQuest to 0 or 1?
Unit 0 Unit 1 Unit 2 etc.
Does it read my internal as Unit 0?

Will AHDI program (v6.05c) be able to interface the SqQuest
or will I need special drivers for the SyQuest?

If special drivers are required, where can they be obtained?

thanks for your help.

Hi! after being offline for a week, I'm back to make more pain
for you all!! ;}

I now have an Atari 605 laser printer! (cost me less than $70.00
for it!), and ofcourse it has no manual for it! So now I've got a
ton of questions for you!!!

1. Can someone either tell me where or can e-mail me some print
drivers for this thing?

2. How do I tell the programs I'm using that I've got a 605? is
that in the driver???

3. The interface is suppost to have the 'phontom'(sp?) mod in it
so that the printer doesn't have to be 'on' all the time. Please
can someone tell me about this?

4. As I have an ICD interface with hard drive pluged into the
TT's DMA port, can I plug the 605/interface into the pass through
port of the ICD interface?

5. Has anyone got a manual for the 605 I can get or get a photo
copy of it?

6. Has anyone got a million dollars they want to donate? ;}

6101. Trap in Devpac 3.01

Newsgroup: comp.sys.atari.st
Date: 1998-09-15 00:00:00 UTC
From: leaver@alphalink.com.au
Message-ID: <6tl9ouooj1@news.alphalink.com.au>
Source record: 93878

If this is old hat to some of you, forgive me.

Devpac permits assembler directives DC.S , DC.D and DC.X for floating point constants. The manual does not say so, but the average mug programmer (i.e. me) might expect it to provide DS.S, DS.D and DS.X for the BSS section as well.

Devpac doesn't, but it doesn't in a nasty way. It ignores the directive but provides no error message to that effect. The label is accepted but no space is allocated. The result in my case, where I had a large fp array as the final item of data, was data overwriting the stack and vice versa.

The same applies to RS.S etc directives. Devpac ignores them without warning that it has doen so.

Good morning,

well I went to bed last nite around 03.00 and I woke up again around 07.15 and the FIRST THING I thought was "let's test this against-filter one more time"... So at 07.30 I tried Erik's homepage once more and guess what: I could D/L the core file in one go, at decent speed.

Installed it, tried the fontselector, IT WORKS, but the settings aren't being saved in the config, I guess.

OK, that's just as far as I go rite now, I'm going back to bed and let you know about more later.

..I lost it!

But you're right about printing problems with Nemesised Falcons - most progs need a spooler to print through or suffer from garbage printouts.

The patch that is (was?) available from Titan's web page doesn't help, at least not here.

Hallo!

Wie kriegt man denn einen modernen Tintenstrahldrucker (z.B. Epson
Stylus 300, 400, 600 usw.) am Atari ST zum Laufen?
Wo kriegt man Treiber her?
Braucht man auï¿½er Treiber und am Parallelport anstï¿½pseln noch
irgendwelche anderen Voraussetzungen?

Da ich noch keinen Tintenstrahler besitze, kï¿½nnte ich bei der Wahl des
Modells auch bzgl. Verfï¿½gbarkeit von Treibern leiten lassen. Welcher Typ
ist zu empfehlen (Voraussetzungen: 720 dpi reichen vï¿½llig, < DM 300,
getrennte Tanks fï¿½r Farbe und SW)?

Fï¿½r alle Tips bin ich dankbar.

Bitte per Mail antworten!

Ciao,

Andreas

Bah, use a real ST. MIDI timing is bad on a PC, let alone on a PC
emulating an ST. Besides, I believe only midi out works with PaCifiST.
It's in the docs.

Cheers,
Nick

I'm just wondering ...

Suppose you reach a page by picking from a pop-up/drop-down menu. You don't think of that as "filling in a form", but that's what you just did, in terms of HTML and HTTP.

Suppose further that this menu submits its data using the POST method, because the author of the script was once bitten by a browser that truncated GET requests after 255 characters and never wants that to happen again.

Suppose further that the page returned by that script contains a META REFRESH which tells the browser to go and re-fetch the page every 60 or 120 seconds, maybe to rotate some banners or some such irritating thing. Then when this is acted on by CAB.APP, CAB.OVL may see this as a "POST re-directed to GET" and pop up its warning dialogue. (Whether this is correct depends on whether a refresh is the same as a redirection. I would say that it isn't, and that therefore CAB's behaviour is wrong: but this position may be negociable. ;>)

IMO such a site is badly broken. Reason: I could not advise any user of
an operating system such as TOS, Win3.1/9x or MacOS to browse the www with
JavaScript enabled. With unix or NT, as an unpriviledged user, maybe: but
never on an OS where every program has access to everything.

I would imagine that it would be possible to add JS to CAB, but it would
be a lot of work and one would end up with a bigger program.

> If Yahoo, Excite, CNN or some other major web players go with JS, what to
> do then??? I'm just trying to be ahead of the curve a bit :)

Ignore them.

> Ahh, in six months we will not be having this discussion. It will be moot.

Ah, but *why* will it be moot? Because CAB implements JS? Because the
craze for JS-based hyperlinks has passed? Because the internet has finally
meleted down?

After a week of being offline I'm back once more. And to just make your day, I've got a bunch of questions too!

I now own a working Atari 605 laser printer. I got it but without a manual too. The interface is suppost to have the mod in it so that you can turn off the printer while not using it.

I need print drivers for it so the printing will go to it instead of the printer port. Also, I have a icd host with hard drive pluged into my dma port, can I use the pass through port on the icd interface card to use this 605?

Anyone know where I can get a manual for this thing from?

Nope.

Dear Mr. Liebscher. It would be greatly appreciated by me and the rest
of the world if you visit de.newusers.infos and news.announce.newusers
before posting again. This article goes to international newsgroups
(comp.*) in which English is the language used, to a BBS hierarchy
(z-netz.*) to which crossposting is not advisable, etc., it has no set
Followup-To: line to one single group, which is highly advised, and it
has a line in it that is hated by any Usenet regular, for asking for
mailed answers shows that you don't even read the groups you are
posting this to.

6114. MIDI controlled mixers going cheap(ish) (UK)

Newsgroup: comp.sys.atari.st
Date: 1998-09-15 00:00:00 UTC
From: xav@compsoc.man.ac.uk
Message-ID: <6tlokhred1@irk.zetnet.co.uk>
Source record: 93891

Okay, so I apologise for not preceding the subject with "FS:" but I figured this might also interest people who have added for sale posts to their killfile on the basis that they don't want more software/a new computer.

I want to sell my 2 MIDI controlled (audio) mixers, and the controller that optionally goes with them. There's nothing wrong with them, but I've bought an ADAT, so I'm investing in a new MIDI controlled mixer with ADAT optical I/O. Anyway, the details:-

2 mixers - Fostex DCM100. Each of these is a 1U rackmount device, with no controls except for trim pots on the front, and a volume control for the headphone socket. There's also a level indicator on the front. Each of these will mix up to 8 STEREO (or mono) sources, with control over level, pan and EQ. All the controls are operated via MIDI messages and are fully detailed in the manuals. Logic comes with a pre-configured environment mixer for these devices, and I suspect that Cubase has something similar. Each of these also has two aux loops for patching in outpoard effects. Each one will also store 100 preset scenes - i.e. the settings of all the controls - so you can recall any particular configuration with ease. The two (or more) devices can also be linked together via a stereo bus to make what is effectively a 16 channel stereo mixer.

Note that because there is no control surface, these will fit into a small room nicely, and you can set all the levels from the computer. You can stack them on top of each other, or other things on top of them, with no problems. Try that with a traditional mixer!

Of course, there are times when you want immediate control of your mixer, so you need a tactile surface to work with. This is just what the Fostex Mixtab provides. It was designed to control up to 3 DCM100s, and allows you to set all the levels, or recall/store the scenes on each. It had loads of knobs and sliders, and each has an associated LED to tell you the current state of it. It offers 3 modes of operation to make it easy to get the controls to the right configuration to match the scene you've just recalled, for example.

This device does not handle any audio data - it just sends out MIDI codes to suit the DCM100. This makes it ideal for situations where you want the mixers themselves distant from your work area (even in another room!) as the audio signal does not have to travel all that way. It also works brilliantly as a MIDI controller for almost any synth or other MIDI device, provided you remap the data to suit, using Cubase, Logic, Notator, etc.

These devices work brilliantly together, and/or with a computer. You can record a mix in your sequencer, then alter individual sections by re-recording them and adjusting the Mixtab controls accordingly. You can even get special

effects by adding a series of volume messages into the MIDI output for a gated effect, or adjusting the filter and pan to make sounds seem to move around (great when mapped to a joystick control on a synth).

Oh yeah, and its footprint is little more than A4 so it shouldn't get in the way. If it does, it's light and robust enough to prop up on its side until needed, or tuck down the side of the table, etc.

Okay, have I sold them enough yet? They've all been used at home only (never gigged), and I am selling each deviece for 150 UKP, or the whole lot (preferred) for 350 UKP. If you think this is too steep, make me an offer, but bear in mind you could be outbid.

If you are going to the ACC show in November, I would prefer to deliver them then. If not, you'll also have to pay postage (the mixers are quite heavy). Because of the weight, I'm not prepared to enter into the hassle of selling overseas, unless you're picking them up from the ACC show.

So, any takers? If you want more information (more!) then mail me (xav@compsoc.man.ac.uk). Go on... help a struggling AC writer to clear some space for his new mixer.

Xav

> THINGRUN is for. I am using a TT030. Is anyone successfully using Thing127E
> with Geneva?
>

I haven't tried out Thing 1.27 with my copy of Geneva yet so I am only
guessing here, but I think the problem could be because you have switched
on the option that makes Thing unload itself from memory when starting
an application. This is useful for single tasking systems with limited
memory, but not so godd when multitasking. Take a look at the Thing config
and make sure that this option is switched off.

If that does not work, let me know and I try it out on my copy of Geneva
to see if I experience the same problems.

Hope this helps.

Regards,

Ben Hills.

It can not edit any samples or use sample dump, atleast not version 1. I'm not sure about what Expand 2 will be able to do and not to do, but I would suspect that sample dump and editing might be in that one.... Emmanuel what will it be able to do?

> BTW, how much does it cost?

I'm not sure, but it's not very much. Take a look at Titan Designs web pages.

Well, this message come a bit as shock actually. TdM has always seemed
to be very supportive of the Atari market, and is one of the last
dealers left in France. They are also in charge of the last widely
spread Atari Magazine.

I would really hope that you and Godefroy could come to an arrangement.
As you say, this sort of behaviour is unacceptable.

Cheers,
Nick

Tamas,

> Does anybody have some info about Portfolio? I have one, don't know
> which model (was there only one type of Portfolio?), what type of
> memory-card uses. Which CPU uses it?

Yes, there was only one type of Portfolio. I uses Atari Portfolio memory cards -- they were made specifically for the Portfolio. The CPU is an 80C88 running at 4.92MHz. Onboard, the basic system has 128K of RAM and 256K of ROM, containing the built-in application software.

It sounds like you don't have an Owners Manual. If you need one, I still have several available in stock. (I used to sell them). If you'd like one, you can have the following bundle for $10.00 which INCLUDES Priority Mail shipping anywhere in the continental U.S. (48-state area):

Portfolio Owner's Manual
Portfolio Quick Reference Card
Portfolio File Manager/Tutorial ROM Card

If you're not familiar with it, the File Manager/Tutorial ROM card adds an excellent menu system for accessing the built-in applications and system functions. It is far superior to the cryptic DOS commands that the basic unit came with.

> I also have a serial interface for it with 9-pin connector, but my
> hand-made null-modem cable (9-25 pin) could not make any progress in
> connecting my STe and Portfolio. Now the problem changed to Portfolio
> and PC. If anybody has a pin-layout from the serial interface of
> Portfolio, contact me.

The pinouts are standard serial, so a normal null-modem cablel will give you a proper connection. Make certain that pins 2 and 3 are crossed in the null-modem cable. Then just boot up any telecomm software package on both systems and transfer your data.

> I think that the little thing can do more than just be a phonebook :)

DEFINITELY! I used to take mine all over the country and use it to type up reports on my airplane flights. It was also great for saving and recalling data whenever needed. There is also a wealth of PD software available for the Portfolio, including some really neat graphics and sound software (there are quite a few music tunes for the Portfolio also).

Enjoy.

6130. First test of Okami

Newsgroup: comp.sys.atari.st
Date: 1998-09-16 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <35ffb87819e4a030@holleman.demon.nl>
Source record: 93706

Hi,

just a small test for my Okami setup.
For the time being I only hooked up comp.sys.atari.st, I just got in 2 messages
and it looks like it's working with Newswatch... :-)

Been working on the configs etc for about 3 hours now(that's mostly reading
all the docs and .inf files etc) and the results look "promising".

Just testing whether or not all the xheader and sig stuff goes OK now.

From: louis@holleman.demon.nl
Message-ID: <35ffc01e1a442270@holleman.demon.nl>
Source record: 93707

And here I am again,

well, after 10 secs I discovered the "export" didn't go well. The exporter complained about a file "sequence.seq" couldn't be found. Checked all the docs and hyps for another hour (plus o.inf) and finally decided to give it a try by creating a zero-byte file with that name in the appropriate dir.
After setting Newswatch "outgoing" to a more suitable dir too, the export finally did what it's supposed to do and I fetched the stuff with Newsie: looks perfect. The only thing is: when I look at the msg in Okami's "outgoing" window, the sig looks messed up. Haven't fetched the article yet, so I'll see what that turns out into.

I gather the main stuff has been done now, so in time I'm gonna hook up all the other NG's and leave Newsie for the time being. E-mail will still be handled by Mymail in the mean time (with a back up to Newsie thru' Popwatch).

Quite a complicated set-up, but that's what I choose for ATM.

I can only agree with the people who told me Okami IS a mighty instrument, but sorting all that out will take some time. Jos: my compliments!
Only slip in the docs IMO is the lack of info on this "sequence.seq" file, but of course it could be I missed that part :-)

From: dreibel@idirect.com
Message-ID: <35ffaf70.0@nemo.idirect.com>
Source record: 93708

I know it's a bit late, but..

tonight TAF will be putting on a demo of MagiC 5.11 at their usual location at the Rose Room in North York Centre. If you've ever been curious about this multi-tasking operating system and what it can do to improve your Atari, see you there! Meeting starts at 7:00.

TORONTO ATARI FEDERATION User Group meetings are held on the Third Wednesday of the Month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge St. at Parkhome Ave. Parking garage inside the complex. Those using public transport can take the TTC's Yonge-University-Spadina line to North York Centre Station. Meetings start 7:30 PM, $2.00 to non-members. Membership is $35 CDN a year, and includes a subscription to the club newsletter PHOENIX and full use of the TAF Online BBS. A membership in TAF IS Atari support!

6136. Mac/Atari Txfr via JAZ?

Newsgroup: comp.sys.atari.st
Date: 1998-09-16 00:00:00 UTC
From: marksimp@-nO-sPaM-integrityonline7.com
Message-ID: <35ffd851.0@205.238.18.7>
Source record: 93712

Is it possible to format a JAZ cart somehow so that it can be written to/read from with a falcon (audio/graphics files) and then transfered to a PowerMac to be read from/written to by the Mac? How about EZ Flyer carts? This would be primarily used for transferring large audio files from Cubase Audio for Falcon, into the Mac for editing, and then back to the falcon for burning CDs. Similar things would be done with graaphics as well.

If this isn't possible is there another way to transfer large files between the machines that is feasible and fast?

Thanks in advance,

Mark Simpson

This is a NOS thing and it consists of a file which stores a running number which is incremented for each message sent. The export program needs it to know what to call the messages (they become 1.TXT, 2.TXT etc) and associated work files as it processes them and puts them in the MQUEUE directory. There won't be anything in the Okami docs as it just expects NOS files to be there. I guess it hasn't affected most users who are upgrading from NOS/Oasis as we already had one in place from our previous setups.

This is probably because your sig contains forward slashes etc which Okami tries to turn into character formatting on screen, eg /this will be in italic/, *this will be in bold*. You can switch easily between this mode and plain rendering with a single key combination (I think it is CONTROL-R by default, though I could be wrong). Without the on-screen formatting your sig looks OK.

See above: it'll be in the NOS docs! BTW I don't know whether MyMail does automatic sorting and threading of incoming mail, but Okami does, which can be very useful if you subscribe to mailing lists. It also has built-in UUE/UUD and MIME support, and an interface to PGP, though I never got round to trying that bit. Worth considering for mail, too I would have said.

Hello everybody,

I want to inform you SOFTJEE propose now a external clock for
Falcon (like JAM clock,...) B-CLOCK compatible. The NEWCLOCK (this is
his
name) is a external clock BCLOCK compatible with 2 frequency : 44,1 Khz
and
48 Khz (you can change the frequency by soft). The box (size 44x40x16 so

little !) is connected to DSP out and have a ligth to know in which
frequency you are.

The price is of 340 FF (about 70$US)

This is all !

That's simply a file that keeps track of your outgoing message
number, so that each message can have a unique ID and your news
server won't reject it as a dupe. Each time you export a new
message, the counter is increased by one.

It goes in your MQUEUE folder and looks like this:

6151. FS: *NEW* Atari 3 Ring Binders $20 for a box (14 per box)

Newsgroup: comp.sys.atari.st
Date: 1998-09-16 00:00:00 UTC
From: tj@oro.net
Message-ID: <tj-1609981332260001@i396.oro.net>
Source record: 93727

$20 plus freight. These are nice heavy duty three ring binders with the Atari logo. 14 per box. All new. Shipping is $15 to $25 (23 pound box) depending where you are in the USA. The closer to California, the cheaper for freight.

It's in the Nos docs at least. It is used to make the name of outgoing
messages/emails.

> perfect. The only thing is: when I look at the msg in Okami's "outgoing"
> window, the sig looks messed up. Haven't fetched the article yet, so I'll see

Because of the "text effects" (look at o.inf to customize them). Try
Control-R and see what happens :-)

> I can only agree with the people who told me Okami IS a mighty instrument, but

We all told you that it's great :-)

Have fun !

: I would like to hook up my TTM194 to my ST. I have read and
: downloaded NEC Multisync II To Atari ST but, no where does it say it
: works with the TTM194. Best Electronics also sells the same type of
: device but, does not mention this monitor. Is there a problem with
: using this monitor on a ST? Any help will be appreciated.

Ummm...yes, there is. The ST is incapable of using a TTM194, although (IIRC), a Mega will with an optional addin board. The TTM194 is designed for the TT (on which it works beautifully). The ST monochrome output is 640x400 VGA-style analog, whereas the TTM194 expects 1280x960 ECL digital input.

You need a SM124, SM125, or SM144 monitor if you're looking for monochrome output. Either get a TT (well worth doing :)), or sell your TTM194 (I'm sure you'll find takers) and buy one of the (much cheaper) monitors listed above.

Maybe the same reason many other programmers 'abandon' their projects
- they get bored.

or it could be they have hit a brick wall and do not know how to
better the software or where to start bettering the program.

or it may be - lack of time!

Updated 09/16/98

I have the following Atari 8bit components and cartridges for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask. I am open to reasonable offers on all items.

Please make all offers in U.S. Funds (buyer pays shipping). I am also willing to trade for some rare or shrink-wrapped/sealed titles for...
- Intellivision, ColecoVision, or various Atari systems
- Shrink-wrapped or mint SEARS Telegames for the Intellivision.
- A working Intellivision Music Synthesizer
- Rarer Mattel and Coleco Handhelds.
- And of course the ever popular, original Intellivision keyboard :)

If you are interested please respond to jim_lazarenko@NOSPAM.powersurfr.com (removing the NOSPAM first)

Hardware Please make an offer
==========
-Atari 800XL With Power Supply, RF Cable
-Atari 800XL No Power Supply
-Atari 600XL With Power Supply, RF Cable
-Atari 520 ST Missing all accesories
Custom made Atari RGB and audio cable. Connects an Atari ST to either a SONY XBR or XBR II RGB Monitor
-Custom made Atari ST Composite Video/Audio cable (standard RCA jacks)

Controllers Please make an offer
==========
-Paddles (multiple sets) -for Atari & Commodore units
-2x Suncom Tac Joysticks -for Atari & Commodore units
-2x Wico Joystick (Black handle with grey base) -for Atari & Commodore units
-1x Spectravideo Joystick with suction cup base -for Atari & Commodore units

Cartridges Please make an offer
==========
- Atari Writer
- Basic
- Centipede
- Defender
- Donkey Kong
- Donkey Kong Junior
- Eastern Front (1941)

- Final Legacy
- Frogger
- Megamania - In a sealed/shrink-wrapped box, box is slightly squashed.
- Miner 2049er

Yes, Imagecopy will do bulk conversions for you.

I'm using Mag!c with Imagecopy4 and Freedom. The later is essential to
multi-select files.

Hi, I'm selling my working Atari 1040STf on Ebay to U.S. bidders, if anyone's interested.

It includes 1 meg of RAM, built-in 3 1/2" floppy drive, power cord, and owner's manual.

It doesn't include mouse, monitor, or any software (TOS, Atari's operating system, is built in).

It ships in the original box, and is currently at $20.

The link is:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=29826649

Thanks,

Daniel

Hi all,

I was just wondering if this game was ever released for the
ST? I had it for the Amiga back in the day, but now that I
have an Atari, I was hoping that this was released for it :-)

If it does exist, does anyone here have one for sale?

Thanks in advance,

-Frank

6176. ScreenBlaster on a MagiC Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-09-17 00:00:00 UTC
From: outrider@lvdi.net
Message-ID: <3600d9aa263d90@lvdi.net>
Source record: 93596

I finally got around to installing ScreenBlaster on my Falcon with my new Sony Multiscan monitor. I believe someone said that the software was up to v1.03. Mine is at v1.01, but seems to work okay so far with my MagiC system.

The largest 'comfortable' resolutions I've been able to obtain so far are 1024x656x16, 800x608x256 and 480x480x32k.

There is a 896x512x256 resolution available, but it looks screwy on my monitor, with whites becoming pink, and the overall display dark.

And there's a 448x512x32k resolution available, but some of it is off the screen. I could adjust the monitor to fit it all on the screen, but I'm not sure the extra vertical lines are worth losing the extra horizontal lines, anyway.

So I'm pretty happy with what I have. Not exactly maxing out my monitor, but much better than what I had. No doubt things are much smaller in 1024x656x16 mode, but still very readable, and really, much cleaner and less blocky. Haven't tried 800x608x256 in CAB yet, but I expect that to be a big improvement over 640x480x256.

I see that the AM stations on my radio display a lot of interference in the new modes, but I guess there's nothing I can do about that.

I'd be interested in knowing what's been updated in later software versions and where they are available in the U.S.

Thanks to all that replied to my previous messages. Anything you can add, regarding ScreenBlaster, would also be appreciated.

It is in the /STING/ folder which contains all the .STM modules.

You must have the file STING.INF in the /AUTO/ folder together with
STING.PRG. STING.INF must contain the full path of the /STING/ folder.

In all the years I've been running Ataris, I've never used the gemdos? or whatever its called. I did find a GEM folder on this system and in it along with a bunch of fonts is laser.sys.

I've got another folder named SLM_LASE.R that also has a bunch of fonts and two sys files, LASERJET.SYS & META.SYS.

Also in the Pagestream folder, the drivers folder doesn't have anything, but in the printer folder it has SLM804.PRT and SMM804.PRT. I don't want to screw things up, so I'm asking about these before I go and mess things up.

I ran a couple of different BBS programs for my ST BBS and I always
enjoy trying out new ones. When I called the RATSoft BBS Support board run
by Steve Hughey I was hooked. I bought it and ran it for years. It's still
my dream to get an ST emulator working with the serial port and run it
again. I loved that program and Steve Hughey was really an easy guy when it
came to getting help or having a question.
I have no idea what the status of it is though. I've tried looking on
the net for a support site but I haven't found one yet. It would be a shame
if he stopped working on it and selling it. In fact, I'd love to see a PC
version of it.

My vote would go to RATSoft if it's still available.

Hi Jos,

good idea! Not everyone is <LOUD MODE ON> as clever as I am <LOUD MODE OFF>
Actually, if you really read what oexport literally writes to screen on the
occasion, you'd go figure out whether or not such a file exists there, and if
it doesn't, it's not all that hard to give it a try...

>
>>The only thing is: when I look at the msg in Okami's "outgoing" >>window, the
sig looks messed up.

> |__ |_| |_| | __| | http://www.holleman.demon.nl |
> | |
> _____
>
I had expected a better one: now it's being screwed because of the underscores!
BTW, I worked the texteffects key to ALT-T, think that's more logical...

In the meantime I've set POPwatch to work mail to Okami, and it looks like that
part works too now.

Wrote some test msgs to myself, the export was OK, POPwatch sent them off and
now I'll go hook up again to C how they come back and check the import.

Just another Q coming up here about txt fx: how does this work? Looks like
Okami reads from the first line, then from the next etc. What I mean is this:
I am trying to get http:// refs in blue here, so I added another line below the
existing lines for bold/skewed/underlined like texteffect=1 4 (http://*) (I
think it was like that). Now when such a line becomes skewed because of a

preceding slash, you won't see it like that.
I could say it different: if I place the line 1 4 (http://*) on top of the
others, would it work better?
Plus, I can't figure out to display the whole stuff
http://www.whatever/anything
in blue and everything else on the line in black..., but <WHISPERMODE ON>
I'm not all that clever <WHISPERMODE OFF>

TYhis allows you to use the Falcon to record at non-stqandard frequencies, specifically 44.1kHz (CD Audio) and 48 kHz (DAT). This is very useful if you are using software that supports the use of external DSP clocks as it means you don't have to do a bulk frequency conversion to record onto CDR or DAT when you've finished.....

BTW, the dongle from Clarity Falcon seems to work OK as an external CD/DAT clock for all audio programs I've tried with it (Quincy, DHS, Audiotracker....)

Source record: 93610

Hi,

This message is being posted on behalf of an Atari user without usenet access, so please send e-mail replies directly to his e-mail address as listed in the following text:

I am seeking anyone with a Protar/ProFile Hard drive connected to their Atari. The boxes and DMA/ACSI-SCSI interface were made in Germany (but are now out of business I believe) and my box contains a (factory fitted I think) 40Meg Seagate ST157N drive.

As well as to discuss specific set-ups, I need a copy of the driver software and disk analysis program that came with it, as the Atari now refuses to talk with it at all, after a couple of years of the HD unit being in the cupboard.

Failing this, some sort of non-destructive, investigative, generic and all-purpose HD inspection prog to get to the data that I'm sure is on this drive.

Please reply directly to: dave.lea@blackbox.at

Gee, it would help wouldn't if the site was actually in *English*. Not that I'm discouraging people from keeping the old systems alive just because they don't do it in English, but it seem a bit inappropriate to be posting the URL of a non-english website to a predominately english speaking newsgroup, since most of us won't be able to understand it. ;-)

No. It makes my brain hurt. The Amiga is a Commodore machine that
was designed by Atari (or ex) employees and the ST is an Atari machine
that was designed by Commodore (or ex) employees.

Just kidding, I'm sure someone will provide you some useful
information soon.

Well, I just set up and tried MyMail version .68, and so far, it looks pretty promising.

I was inspired to try it by the one and only Louis Holleman. ;^O

BTW: I had no trouble at all downloading it from Erik's web page. It came through very fast. I also grabbed a few other little programs he has there and they came through quickly too. I guess that "Holleman filter" doesn't affect everyone else!

Anyway, at first it didn't work because I hadn't defined (in my STinG DEFAULT.CFG file) the 3 variables that MyMail (and POPGEM) need in order to work:

POP_HOST =
POP_USERNAME =
POP_PASSWORD =

I'm not sure why NEWSie and POPwatch don't require these to be in the DEFAULT.CFG file like this (the information _is_ in there, just in a different way). Anyway, there didn't seem to be anything in the MyMail HTML doc files telling me about this, but I remembered seeing something about this in the POPGEM doc file -which up until today, was another program I hadn't yet tried. So I just figured MyMail was looking for the same thing, and after putting that in my DEFAULT.CFG file, it worked.

I tried sending a few e-mails to myself, and checking for them with MyMail, and they came through fine. No problem sending them, no problem retrieving them. I had a little difficulty getting the built in "text editor" to actually SHOW what I was typing when I tried to send my first e-mail - which didn't occur when I was typing in something as a reply to an existing e-mail... (?)

And Louis, I haven't had any problems with the font selector within MyMail as far as CRASHING goes. It allows me to select any of my loaded fonts. However, they don't seem to actually be USED by the program itself. Perhaps it's not fuly implemented yet?

And as far as your problems with font selection:
I don't use that MAGXUFSL program I'd seen someone mention. I use the AUTO folder program FONTSEL 1.09. Perhaps if you haven't already tried it you should? Although with MyMail, I don't think it uses this - at least the font selection interface of MyMail doesn't look the same as when FONTSEL gets called up from other programs. But I haven't tried MyMail without FONTSEL loaded yet.

The program definitely has a nice look to it, and although I've just barely started testing it, it seems fairly stable. I still have to look into it a little more. It seems to have a lot of cool functions - although I think I'd rather use an external editor (QED) for composing my e-mails. And I would prefer if the BubbleGEM popups were activated in the traditional <right click> way as well (of course after getting used to the program, BubbleGEM won't really be needed anyway).

I also tried POPGEM a bit. It seemed to work but I need to read the DOCs and test it out some more.

How's everything going with you and MyMail Louis?

Yep, had the same problem and used the same solution. I was thinking about asking Jos to include a note in the docs but figured there were so few folks migrating to the program that I didn't bother. That, in retrospect, was probably a mistake.

>Reconfiguring isn't really user-friendly, handling all those info
>files in a text editor, but once set up it's awesome.

It's better to delete the bulk of the text (keep the titles), IMO, and refer to a copy of the full docs when necessary... eventually, it's not very necessary. Also, get the latest version and read the update notices; Jos has added some very nice features.

>But: I can recommend it to any Internetter!

Same feeling here. Now, just include POPwatch for Email and you're all set! ;-)

You're a bit (maybe a LOT) tough, here. Peter has done an excellent job and the stack works excellent for most. Finding the last remaining incompatibilities is difficult for a team of programmers/designers, let alone a lone programmer.

StinG has *always* worked well, here. I have to admit, though, that it works even better since I switched to MagiC recently.

Once again, thanks Peter, for a job well done!

Hello there,
It can be found at
http://dhs.atari.org
However it is not a "clone" but infact the real thing (emulated of course)
There are 2 versions available, one for Godboy (game boy emulator) and one for
GodleNes (NES emulator)
Ive found that for the godlenes super mario brothers, It only really runs at
full speed (?) with an accelerator like Nemesis installed...
Hope that helps!

>
>Thanks...

It's funny you mention this. I just lost my default.cfg yesterday, and restored it with a backup. I checked my hard disks with Diamond Edge, and it didn't even show up as a deleted file (I had just deleted cache.dns from the sting folder, so I thought maybe I had accidently deleted default.cfg)

Anyway, default.cfg is just a plain ascii file that you can generate yourself. I'll send you a copy of mine via email once I've edited out the passwords, etc.

One final thing (I really don't believe it applies, because you say you've looked at everything in the STinG zip) - make sure you have sting.inf in your AUTO folder, giving the correct location of your STinG files.

Source record: 93647

comrade

you could get an old portable tv for that much, use mono emulator for hi-res
... not ideal
maplin electronics do a convertor lead for old philips monitors, very cheap if
you can find one I'm sure ... still have to use emulator for hi-res although
picture will be better than tv ..
monitors that came with Amstrad CPCs work too with some lead fiddling, I wouldn't pay more than a fiver for one of those, mono emulator required again
..
also any other RGB monitor should work in same way although you'll need pin
outs for lead ...
don't go for an old vga, often problematic, very few match necessary refresh
rates for colour modes let alone mono...
best bet is an old PC mono monitor which gives a very crisp hi-res picture
without emulator but obviously no low or med res ... (this was my solution
until I found a boxed SM124 for ï¿½8 in a junk shop ... I was a happy boy that
day :]) Not all PC monos work so it's a bit of a minefield, I can give you
pin-outs for st and 'standard' mono PC monitor, but again not all of 'em seem
to be 'standard' (now there's a surprise for the PC world) ...
If you can't find a cheap SM you will have to get out the soldering iron whatever you find ...

good luck,
jim

Peter dedicated a lot of effort into the project, and still supports technical issues on a regular basis here. I don't think I would entertain the idea that he abandoned his efforts, he is much more serious than that. I know that I was pleasently surprised when I realized this guy was going to go the distance with his package.

It's a team effort here, and maybe it's just time for another player to take the ball (round or oval:) for a while. I'm sure that his efforts have not ended and that he is even now advising another on what is to be accomplished next.

I am constantly amazed at the quality software that is developed for our simple platforms. E ticket software for the price of a 10 cent icecream, and every bit as good.

NOTE: WILL TRADE ANY OF THE ITEMS ON THIS LIST FOR PC EQUIPMENT-Hardware
and/or Software

Hardware-

ALL hardware is in good to excellent 'used' condition and pre-tested before
shipping.

1040STf's-(still going strong!)1meg-used/tested.....$40ea.
Includes Atari Mouse or Marconi/Marcus 3 button track ball, your choice.

Atari SC1435's -14" stereo RGB monitor, headphone-jack, video cable,
used/tested...$60ea.

Atari SC1224 12" Color Monitor - used/tested..$40.

Atari System: 1040STf + SC1435 + Atari Mouse or Marconi Track Ball-all
items used/tested.......$90.

Atari PCM124 12" Monitors-New-$20 ea. Original box and manual.
Believe these were used on 286 type computers and Atari's short lived
PC. Two units available. 7-Pin video cable.

** LYNX STUFF: **

LYNX II -used but works great except the external speakers do not work.
Need headphones to hear audio. * SOLD *

LYNX Kit Case-Carry Case-NEW
12"wide 9 1/4" tall 4 1/4" deep-$12

LYNX AC Adapter- New -120V 60Hz-$8

LYNX battery pack-holds 6 'D' Cells-excellent shape.-$8

LYNX NAXI Power Pack-rechargeable, includes A/C charging unit.
Used but ni-cad batteries are in good shape, still hold a good
charge. Asking $10.
LYNX Sunshield- $5

*** LYNX GAMES ***
Used but like new
All games have original box and instructions except O.E.M. games listed:

Baseball Heroes...$10
BattleZone 2000...$12
BlockOut.............$10

Blue Lightening.....$15
Hockey.....$10
Joust.....$12
Shanghi.....$12
Steel Talons.....$10
Super Asteroids/Missle Command...$15
Toki.....$10
Warbirds.....$20

O.E.M. Games - full instuctions/no box

Batman Returns...$8
Hard Drivin.....$8
Shadow of the Beast...$8
S.T.U.N. Runner...$8

>
Well Pat,

it's a bit like my mailer system, with Semper, LED and IOSmail.

The configs have bits like my mailerconfigs, so it wasn't that difficult.
Reading the docs is essential however and it's a bit "spartan" to handle, but
it sure has potential. Most difficult part was the sequence.seq file, since I
don't use NOS so that was the surprising section. Looked carefully about what
oexport was complaining and decided to give it a try with a zero-byte file. It
just did the trick :-)
Reconfiguring isn't really user-friendly, handling all those info files in a
text editor, but once set up it's awesome.
I'd been reckoning needing more time to have it running, though... :-)

But: I can recommend it to any Internetter!

6213. Atari-Friendly web design?

Newsgroup: comp.sys.atari.st
Date: 1998-09-17 00:00:00 UTC
From: screenstyles@hotmail.com
Message-ID: <6tqfjp$85k$1@nnrp1.dejanews.com>
Source record: 93652

Hello,

I run a website devoted to sampling and general music-tech things. http://www.geocities.com/SoHo/Museum/4312/ I use a PC for web design, but I am a committed Atari ST user as far as music and anything important is concerned. I want to develop my site further, and I had been planning to badge it as 'Atari-Friendly'. However, I have no idea how sophisticated CAB and similar browsers are. Are there any gimmicks that I should particularly avoid? As you will see, I like to keep things pretty simple anyway - it loads quicker that way. Are JPG and GIF images prohibitively demanding for ST surfers? Is there any degree of JavaScript support in CAB?

Let me know. Your opinions WILL make a difference.

>drivers for this thing?
What programs do you want to print from? You can use SLM805 drivers with
your new printer BTW.

Try the diablo driver from ftp sites (this at ftp.lip6.fr:)

Text/slm.zip : drivers DIABLO630 pour laser ATARI

Which will at least allow you to print plain text files.

>2. How do I tell the programs I'm using that I've got a 605? is
>that in the driver???
Most progs give you a choice of drivers, pick the SLM driver if there is
one, if your progs print via GDOS, NVDI or SpeedoGDOS then you're laughing as
all those have Atari laser drivers.

>3. The interface is suppost to have the 'phontom'(sp?) mod in it
>so that the printer doesn't have to be 'on' all the time. Please
>can someone tell me about this?
Usually you have to have the printer switched on to power the interface,
which would otherwise load the DMA port and prevent you from accessing
drives. I don't know the Phantom mod but there's a couple of DIY ways of
fixing this.

>4. As I have an ICD interface with hard drive pluged into the
>TT's DMA port, can I plug the 605/interface into the pass through
>port of the ICD interface?
Yes - but the manual suggests that the printer be plugged into the DMA port
and the hard drive adaptor into the through socket on the back of the
controller.

>5. Has anyone got a manual for the 605 I can get or get a photo
>copy of it?
I do have a manual but I'm in the UK - really there's not that much to it
except that a built in counter prevents you from printing after 10,000
copies, at which time you have to put a new drum and counter in. Someone
once told me that they'd modified the drum counter to remove this
restriction but he never gave me the details.

Mannesmann Tally MT906 consumables fit your printer.

>6. Has anyone got a million dollars they want to donate? ;}
Errm, no! :-)))

I need to find the original ST-Ram card from Atari, which provides
8 Mb of ST-Ram in addition to what's already on the TT motherboard.

E-mail me the details and your price, if you have one for sale.
Thanks.

Yes, this is possible. The software coming with HDDRIVER allows to
create a cartridge with a single partition which is _at the same time_
DOS and TOS compatible. TOS and DOS/Windows can use this partition for
data exchange without any additional software. DOS partitions can also
be mounted with special software on the Macintosh.
If you have HDDRIVER and Big-DOS or MagiC you can read and write DOS
compatible partitions right from the start.

No Atari Sparrow was ever released by Atari. I think there was a
prototype at one point called the Sparrow. It might have been the
Falcon040 proto or a Falcon-based console, maybe even something else.

If you've seen one for sale, it's either a valuable collector's item, or
complete bullshit.

Cheers,
Nick

Yes, that is inconvenient. I changed that, and from now on Okami will
create a new sequence.seq if it doesn't exist. Originally, this part
was written for users who already had a NOS setup.

>The only thing is: when I look at the msg in Okami's "outgoing"

Yes may be but as a official devpac owner i prefer to use Mon insted buy another debuger. May be BSS debug is very good but the demo version i've downloaded does't work on my AB040 and i wont buy somthing i can't test before.So if someone know where i can find a 040 patched version of mon, let me know.

Basically, you should avoid frames and Javascript. Graphics are ok, as
long as they can be deactivated without losing too much in terms of
content: Use the ALT tag, and if you use imagemaps, always put
equivalent text links somewhere on the page.

Cheers,
Nick

The Sparrow was basically an upgrade for the STE with a 68030, DSP,
sound and graphics (?). It was never released, which I guess never was
the intention. It ended up as the Falcon, which is nothing but a STE
with a crippled 030, a new DMA-system (with DSP, sound and SCSI) and
better graphics.

If you're used to Mon you'll hate BSS Debug (at least I did). It claims
to be somewhat 'compatible' with Mon, but all the nice features are missing
and what's there instead (Mouse support and windows) isn't of much use
(BSS Debug doesn't allow you to do anything useful with them).

You've done better than me - I get the Pacifist logo and then the window
shuts (I'm using fuji-bar or something to launch it).

Checked with an ohmmeter.Is ok.

> Use HSMOdem7 as serial driver on your atari.

I already used it.

> Switch on RTS/CTS !

Done.

> I think this is not a problem of STinG/CAB, maybee driver or cable..

The problem remains:
HS, DSR, CTS, EC- LEDs of the ZyXEL 1496E plus are on
and TxD and RxD are flickering.

Is it possible that the ZyXEL is in some strange mode (FAX?) where
it tries to send something to the Mega2 (which of course fails)?

ME

The separate parts are upgraded, but the basic design is the same. The
Falcon is a hot-rodded STE, while the TT is in many aspects a
completely different machine (32-bit all the way, the new RAM-model).

It should have came with your STinG package. As for where it should
be, you should have a file in your AUTO folder called STING.INF, with
a line containing the path to your DEFAULT.CFG, e.g.:

D:\STING\

First, I would recommend getting Selectric. I don't know that much
about UIS, but Selectric is very stable and has much the same options.
The PageStream problem is with the fonts. Again I don't know why, but
if you reduce the number of fonts, you will notice that it will start
up much faster. It's funny as it does boot much faster on an ST. Maybe
someone can give more detail. Start PageStream again and give it about
five minutes and play around. It should come up.

>needed on my particular Falcon - although I tend to disagree with this because

The Falcon needs the buffer mod. I don't think anyone with a Falcon
will debate that unless their not using the DMA or SCSI bus..... The
FPU and Expansion clocks inputs can get away without it, but not the
DMA in almost all cases. For someone to state that the machine didn't
need the mod, they would have have to had the machine on a bench with
a scope, a logic probe, and a hell of a lot of knowledge about the
problems concerning some areas of the Falcon motherboard as well an
indepth knowledge of timing solutions.

Another mod that Atari did was to cut the clock trace feeding the DMA
and loop a wire around the inductor (just in front of the DMA). The
trace makes a sharp bend in that area and the clock benifits by this
modification. That line is somewhat tied to the FPU clock as well. In
very troublesome cases, it is best just to run a wire from the buffer
mod to the DMA clock in, with the trace being cut just before the
clock in to the DMA. This is simular to the Nemesis modification.

Check the iron ring around the powersupply wires. Make sure it sits
away from the IDE drive too.

A good source for pinout information, is the Falcon Field Service
Manual available from a couple of Atari dealers. Some of the
schematics are floating around the web, but wouldn't it be nice to
have your own copy?:).

Anyway, there didn't seem to be anything in the MyMail HTML doc files >telling me about this, but I remembered seeing something about this in the >POPGEM doc file -which up until today, was another program I hadn't yet tried. >So I just figured MyMail was looking for the same thing, and after putting >that in my DEFAULT.CFG file, it worked.
>
I think (emphasis on think), MyMail works OK on the SMTP server alone. Not so with Popgem and POPwatch, these use the POP3 servers (hence the names). As Erik's already explained, this can be set in the users def info.
BTW, you can set up a POP3 thing in Newsie as well. Look in the configs.

>And Louis, I haven't had any problems with the font selector within MyMail as >far as CRASHING goes. It allows me to select any of my loaded fonts. >However, they don't seem to actually be USED by the program itself. Perhaps >it's not fuly implemented yet?

Again, Erik jumped in before I did, but I don't follow these lines completely: you can select other fonts but do you mean they won't show up in the windows? They do here... Only thing that won't work (but there's no option either in the config file) is saving this for the next start. It means with every start of MyMail you gotta set a different font again. I gather Erik's working on a solution for that. Anyway, since I fetched 0.68 it works OK. The crashes were only with 0.64.
>

>I also tried POPGEM a bit. It seemed to work but I need to read the DOCs
and >test it out some more.

I only fetched an early version when it was announced and it didn't do
much here... To tell you the truth, I forgot about it. Looks like I've got
stuff enough for the next couple of weeks to fool around with...
>
>How's everything going with you and MyMail Louis?
>
Well, like I said, I still play around with it. Right now I've got Okami
set up for e-mail too and it looks like it's running perfect. The rest is
finetuning, like using the "gimmicks" to display http:// refs in bold
blue, X-headers in red etc. Maybe change some fonts again in different
windows... still plenty to play around with. MyMail will be on the
"parallel track" in the meantime, checking updates etc. One major
difference between the "Okami-bunch" and Newsie, MyMail etc. is the fact
it's not all that easy to reconfigure when you change things. Adding
another NG needs fumbling around with several INF and DAT files in a text
editor. Here Newsie was simply great. Same is for binaries groups
(although I haven't done much on that with Okami), but rite now I praise
Newsie for the fact that you can D/L a binaries group overview for
offline, then check the XOVER.TXT file for contents and after that take
your pick on the article numbers. I gotta figure that one out using
Newswatch/Okami. Furthermore, handling of all the NG stuff in Newsie was
real fast: read, delete, read next, delete, read next, keep, etc. etc.
With Okami it's more like Read, delete (= click/click/click/click/click to
get the flags set and move on to "next"), read and so on and so on.
Collecting a fast growing addressbook with e-mail addresses in Okami is
unmatched, though... Praise Jos!
Another one I REALLY LIKE is the easy working spam-filter for POPwatch: I
managed to reduce the bloody spam e-mails to 50% in only three days...
Right now I'm literally waiting for the next one to shove it into the
filter too, whoopeee!
Well, one final note about MyMail: I discovered that dragging a binary
onto the bottom part of MyMail's edit window to attach a file didn't work.
Need some more time on that part, but according to the docs it should have
been a matter of just drag 'n drop...

I had a similar problem with pagestream 2.2.
The time to load was long, very long.
I had to change fast load flag to ON for all printer driver and
export/import modules to correct this problem.

With 14Mo of ram you can save time with fastload flag actived, but
this does not work with all programs(just test).

That is not necessarily a problem of the TCP stuff from
Peter.
Try the traceroute utilities on several (known to you)addresses and you will
see that there are certain sites that are always slower than others.
Also try to traceroute to your own machine 127.0.0.1.

> I know I am not the only one having this problem because I

I'm very new to the TCP stuff on ATARI
(you can check that with DejaNews) and yes - it is
sometimes difficult (see my thread about my problems
with the ZyXEL).
But before I haven't excluded all other possibilities,
I wouldn't dare to e.g. blame Peter's good work.

>Okami reads from the first line, then from the next etc.

Yes, the regular expressions in o.inf are evaluated in the order you
write them, except that reg exp beginning with `^' are always
evaluated first.

>What I mean is this:
>I am trying to get http:// refs in blue here, so I added another line below the

>I could say it different: if I place the line 1 4 (http://*) on top of the
>others, would it work better?

Yes. But first you must study regular expressions. `http://*' doesn't
work, of course (the parentheses aren't necessary). The meaning of the
asterisk in regular expressions is different from wildcards.
`http://.*' would be almost correct, but has the disadvantage that the
entire rest of the line will be bold and blue. Try `htp://[^]+' and
put it before the other `bold' expression.

Mine connects at 152000 :-)

First of all, what is the max speed of your modem? Mine is a 56K
Flex.

Secondly, I too was getting abysmal connect speeds with Stik, but then I
upgraded to Sting and it works a treat.

You also need HSMODEM to enable higher port speeds on the Falcon, and
do away with the standard CPX you get for setting port speeds. The
one you want is SERIAL.CPX (I can send you a copy if you can't get
hold of one) and it allows much greater speeds.

What is the maximum speed that your ISP will allow? Obviously, you
can't connect at anything more than that.

Hope this is useful.

Chris.

This particular SCSI-problem is a hardware problem with the Falcon, but the time delay depends on which harddisk driver you use. When I still used AHDI, I never noticed the SCSI-hangup, because the reset came faster than with other drivers (and maybe because I had less SCSI-units on the bus). With the ICD versions I've tried, the hanging never gets resetted - it just keeps hanging and the same goes for some old versions of HDDriver. When I used SCSI-tools, the reset came after about 20 seconds. Now I use HDDriver, which takes about 30 or 40 seconds (I haven't timed it, since I've gotten used to the problem and know there's nothing to do...), before the SCSI-reset comes. HDDriver includes a small program to be put in the AUTO-folder, which tries to fix the known hardware problem. However, I would like to have the SCSI-reset performed much quicker than it's done now - if an error is detected, wouldn't it be possible to reset the bus within just a few seconds?
You absolutely MUST do one of the clock modifications to get it running at it's best. The one that was required in my Falcon was number two on my homepage, but it may vary from machine to machine.
If you don't use Cubase Audio, you may still experience problems of the same kind (it's more apparent with CAF though) - if you set the display to 256 colors and 640*480 and try to copy a lot of files from one partition or harddisk to another, you're likely to see the hanging problem.
Summary: It's a bug in the Falcon hardware and NOT a bug in Cubase Audio...

I'd say it's enough to see the waveform of the unmodified boards´ CPU clock to know there's a potential problem. As it is a clock signal, it should be a perfect (or close to perfect) square wave - which it absoultely isn't. Falcons which don't seem to have the problem have somewhat cleaner waveforms, but I don't think they're good enough either... After the modification, you can see on the oscilloscope that the edges on the square wave are MUCH cleaner and much closer to a good square.
This clock is very critical since it feeds the CPU and other IC's with their clock, so if there's a problem, the machine simply has no chance to work properly.

>Another mod that Atari did was to cut the clock trace feeding the DMA

Hi Jos,

well, I forgot to mention the . in the string I mentioned, but it was
working already on the whole line following http:// in bold blue.
Studying in Regular Expressions, huh? Well, before I get my "bul" - and to
the others I explain that a "bul" is a Dutch Expression, meaning you get a
PhD in something, like the Jerries have their Herrn Dr. Diplom. Ing. stuff.

OK, so now Herrn Dr. Diplom. Ing. Prof. Holleman will try it with the
string you just gave me and start in his spare time to study "RE" :-)

The English text follows the French one.

V-TRAX est enfin DISPONIBLE !

Vous pouvez ti¿½li¿½charger la version di¿½mo sur notre site internet :
http://www.emi.u-bordeaux.fr/~ricard/

V-TRAX est le logiciel de montage audio multipiste sur Falcon. Il permet de
gi¿½rer jusqu'i¿½ 32000 pistes virtuelles et autant de piste ri¿½elles qu'en permet le

hardware..
Sur Falcon, vous avez droit i¿½ 8 pistes ri¿½elle parmi 1024 virtuelles. En
clair, le montage s'effectue sur 1024 pistes mais vous ne pouvez en i¿½couter que
8 simultani¿½ment. Bien entendu, vous pouvez ri¿½aliser des "mix-down", c'est i¿½ dire

mixer en temps ri¿½el 8 pistes sur une ou deux pour la sti¿½ri¿½o.

Pour un descriptif complet, venez sur notre site Web.
Pour le commander, contactez notre editeur :
CENTEK
4 Av. St Exupi¿½ry
60180 NOGENT S/OISE
FRANCE
Tel : 03 44 74 63 30
Fax : 03 44 74 63 40
e-mail : phenix@centek.fr

V-TRAX is finally AVAILABLE !

You can download the demo version on our internet site :
http://www.emi.u-bordeaux.fr/~ricard/

V-TRAX is the Audio Editing Station on Falcon. It allows to manage until
32000 tracks
potential in a timeline and so much real track that allows the hardware..
On Falcon, you have straight to 8 real tracks among 1024 potential. In
clear, the montage undertakes on 1024 tracks but you can listen only 8
simultaneously. Of course, you can realize a "mix-down", it is to tell blender
in real time 8 tracks on one, or two for the stereo.

For a complete descriptive, come on our Web site .

6275. Re: Atari or Amiga

Newsgroup: comp.sys.atari.st
Date: 1998-09-18 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de
Message-ID: <199809180000.a26826@lu.maus.de>
Source record: 93514

Hello Mikhol74,

m> Could someone please give me the pros and cons of the both the Amiga
and
m> Atari ST? Thanks.

As you mentioned the ST, I think you mean the first versions of both
computer
lines at that time:

Atari 520ST/1040ST:
+ Really "Plug and Play". You need nothing but electrical power. Just put
in
the 3 cables (power supply, monitor and mouse - plus an external floppy if

needed/not built in) and start to work (just a litte bit like the new iMac
-
wich is in Germany *exactly* as "cheap" as the ST was at introduction
23(?)
years ago: 3000,- DM :-) in most countries (TOS exists in every major
language of the western hemisphere and it is *built in*)
+ Outstanding, eye-friendly monochrome monitor (70Hz) to *work* with
+ Very simple, fast, stable and smooth to work with (fast, modern CPU
(68000,
8MHz) *and* fast and stable graphical operating system, which is very easy
to
use). The item that an average ST user uses less than others is the
handbook.
+ Built in MIDI ports for music synthesizer (widley spread at music groups

and studios)
+ Uses DOS type disks and other mass storage (HD, Syquest, ZIP) for easy
exchange of data
+ Many (sometimes outstanding) programs and support (but especially in
German/
Germany)
+ Much memory in basic hardware (1MB upwards, just the very first ones and
a
later "cheaper series" came with 512 KB), nearly nothing consumed by the
OS
+ Easy to program with
+ Uses ACSI (a stripped down version of SCSI) for easy and fast use of
SCSI
devices (buy a really SCSI adaptor and use even actual hardware, because
of
the OS/driver, you can also say "plug and play" to any kind of mass

storage -
even easier than Mac)
+ Easy to update to HD disk drive
+ No "year 2000" problem :)

- Atari (;-> ;-()
- Needs 2 different monitors (or a special one) to use "both worlds" of
work
(monochrome) and games and graphics (colour, but you can use the TV as
well).
- The first versions need an external disk drive, later it was built in
- Difficult to program outstanding games/graphics
- Difficult RAM upgrades and RAM limited to 4 MB (with some third party
upgrade to 14 MB - the 68000 CPU itself is limited to 16 MB)
- Printer port is really a printer port (compatible with PC if you use a
printer, but not compatible if you use other devices)
- A "year 206x" problem ;) (I don't know exactly, but somewhere in the
future
;-)
- Complicate to hang to the internet

(OK, at that time, at least the two last points were no argument at all
;-)

Amiga 500:
+ Outstanding graphics and built in sound capabilities (-> good games and

graphic programs) because of custom chips
+ Different graphic modes/resolutions at the same time on-screen
+ Multitasking OS
+ "Built in" commandline shell
+ Built in disk drive
+ Flexible use of disk drive(s) (complete programmable)
+ Easy to program outstanding games/graphics
+ Easy RAM upgrades
+ Easy to update to better CPUs (especially Amiga 2000 and higher)

- Commodore (;-))
- Originally designed as a gaming system, not as a computer with floppy
and
keyboard
- Difficult to use (complicate and unstable OS, mixture of GUI and
commandline)
- Slow to *work* with (as long as you use the original 68000 CPU at 7,2
MHz)
- Slow floppy disk
- Own disk format (not compatible with anything else)
- Much to less memory in basic system

As the time went on (STe/TT/Falcon/... and 2000/3000/...), both systems
got
bigger and came closer (and the old versions can be emulated now by actual

Wintel-PCs or even Macs ;->):
Atari got
- multitasking
- more memory
- faster CPUs
- better built-in sound and graphics capabilities

Amiga got
- better to work with (because of more stable versions of the OS and
faster
CPUs)
- "built in" support for DOS disks
- more memory

Greetings, Oliver

6279. SM124 Problem

Newsgroup: comp.sys.atari.st
Date: 1998-09-18 00:00:00 UTC
From: Steven Cook <steve@babcom.u-net.com>
Message-ID: <3602CDA7.D1B119D4@babcom.u-net.com>
Source record: 93518

Hi,

My SM124 died recently after 10 year's service. After taking it apart I found a blown capacitor (2.2uF 50v non polarized) which I replaced with a higher rated (100v) but physically smaller part. This worked fine for a few hours then blew again. I have a schematic but cannot see what might cause this cap to blow - can anyone help?

Thanks,

Steven Cook.

6280. POPwatch Timeouts!

Newsgroup: comp.sys.atari.st
Date: 1998-09-18 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6tuff5$bhb@enews2.newsguy.com>
Source record: 93519

I posted a similar question a few weeks ago, but got no response, so I'll try again:

I'm having a bit of a problem with POPwatch (2.73). If I receive an e-mail with a large file attachment (example: today a friend sent me an MPEG that was about 4.5 megs), POPwatch _will not_ even tell me that I have e-mail. It connects, and then just sits there until I get a "user timeout expired" message. For some reason large e-mails (or many small e-mails) are a problem for POPwatch; it can't seem to pull in the header information. And I see no way to change the length of time before a timeout occurs. I've e-mailed Gary but haven't heard from him either.

Also, when this happens, often NEWSie will do the same thing. If I do a "check mail" in NEWSie, it sits for several minutes - basically locks up. I have to hit ESC, at which point NEWSie informs me I have "0 mail" (which isn't true).

And after this happened today with the single MPEG e-mail, I also tried MyMail. It basically did the same thing - sitting for a while then coming up with a message saying there was an error or I possibly had a bad password (not true).

The only way I am able to get e-mail when this happens is to log onto my ISP with a term program (they also have a "shell account" for this purpose) and then I can get it and download it without problems. But, I'm thinking of switching to another ISP soon, and they don't offer this term program / shell account access. So if I get a large e-mail, or too many, I'll never be able to see them. And it would conceivably prevent me from ever getting any e-mails once there were too many!

Any suggestions???

Switching to the Falcon required that a few autofolder programs be added and
a few deleted. Anythng ST-Specific like TOS14FIX must leave. Things like
FPATCH probably need to be added. I don't use UIS III, but Pagestream 2.2
works fine on the Falcon (though for some reason the load time of the program
is a LOT longer -- anyone know why?) Galen (Head YACcer, Yolo Atari Club)

Thank you all for your responses. I really appreciate it. To answer someones question, I would like to use the computer for BOTH graphics and music. I suppose, music would be the priority of the two. Which Atari ST models would be good for these things, 520, 1024, or what?

Also, can the ST be used to get on the internet (what kind of modems can be connected to them, external PC-type modems, or what?)

Once again, thanks.
Michael

I don't think it is the size of the file, but the way the header of
this email is.
Have you tried with POPGEM 2.1?

btw starting a project like popgem and smtpgem is not for fun only.
But Just that no emailer prog so far on atari work efficiently. They
make me mad. MyMail seems to be the most promising.

Source record: 93524

Greetings!

I have this little gem (excuse the pun!) that I don't think I'm ever going to get around to figuring out. Plus which we are about to move and the less I have to haul around the better. So, I'll let it go the the best reasonable offer (I"ve looked to see what dealers charge for them). The system is:

Atari Mega ST2
Atari SM 124 Monitor
Keyboard, Mouse, power and connecting cords.

All in great shape, virtually no scratches, or blemishes. All works perfectly. No software (sorry, if I had some I'd probably keep it!). I don't know how to tell which version of TOS is on it or how much memory (I'm guessing 2 megs) but I'll be glad to try to answer any questions you have.

Please reply by email or phone.

Can anyone help me? The Papyrus driver in Straight Fax 2.50
works unproperly. I've tested it with Papyrus 3.62, 4.25 and
5.02 (German demo version), but it goes on dirtying the printer
setup dialog with strange help bubbles besides showing an alert
["Part of the page layout lies outside the printable area for
this printer (TOP -2367677 mm, bottom 0 mm.) and may not be
printed] just after clicking on the 'Print' button in the print
dialog...

> avoid?

Yes ... ALL GIMMICKS!! ;)

> As you will see, I like to keep things pretty simple anyway - it loads
> quicker that way. Are JPG and GIF images prohibitively demanding for ST
> surfers?

not at all, just keep 'em small/high compression -- also many ST surfers surf in
mono

> Is there any degree of JavaScript support in CAB?

zilch ... CAB does support most <form> tags however

also keep in mind that many St surfers surf with 14.4k as 28k access requires a
serial port mod that many don't bother with

best thing to do is download an emulator for the PC and CAB (demo support
graphics? can't remember), then you can test
pages on PC -- I did this with TOSBOX, worked a treat

viva atari

The Atari users tend to be very helpful. This is from many years of
experience.

The Amiga users tend to use a simple help question as a reason to
start a flame war. This is also from many years of experience.

The ST OS is very stable

The Amiga OS is not

The Amiga has some really cool expansion options, like a PPC
accelerator.

The ST has nothing close to the expandability of the big box Amigas.

The bottom line is preference, use whatever makes u happy

Please don't encode your posts.

You are talking about Godlenes, or are you talking about STario World.
Stario can be found on the Computer Dungeon's website and is
shareware. Godlenes is an NES emulator for the F030 it should be
located on their website. Obviously if you don't own the original
game then it is piracy and you are supposed to delete it. The
emulator is pretty cool. They have about 14 of the NES games now for
those that own the originals.

Yes I know, Falcon are supposed to eat mice and other small furry creatures, but my Falcon is enlarging the connector holes. This is causing the problems I had before with the keyboard. It is the bottom left pin. Is this pin supposed to be bigger than the others.

Thanxs

Source record: 93635

Just got a Falcon the other day. It has 14 megs memory and am using the VGA adaptor. The problem seems to be that certain programs that have work fine before no longer work at all or do really strange things.

Do these programs work with the Falcon?

1) UIS III
2) PageStream 2.2

Programs which no longer at right is ones like CAB it tends to lock up alot during information transfer.

The dialer no longer will connect at 19200 (connects at 9600) though the modem.cpx is set for 19200. This all worked fine before switching to the falcon.

Also when using MaciC 4 and using the dialer for CAB it gives me some error about not being to transfer something or another to CAB

I really thought the Falcon was suppose to be a much better machine that the older ST's? Anybody have an idea what is going on here???? HELP

Thanks in advance!!!!!

Hi there Terry,

I know that you are running a Falcon. The other day I finally got myself one and now am starting to have problems running programs that I could run on my Mega STE. The firs two and the ones I like the best are UIS III and PageStream 2.2. When booting UIS III bombs out with about 15 - 20 bombs on the screen and if I try loading Pagestream 2.2 it starts to loas and than just sits there with the busy bee. Always have to reset the machine to get it to work again. Tghe dialer for CAB no longer will connect at 19200 (always at 9600) though the modem.cpx is set at 19200. Cab itself locks up all the time when going from web site to site. Time to reboot again. Any ideas what the hell is going on with this stupid system? are you running CAB and pagestream? Hope to hear from you soon.

Thanks David in Portland,Or

Do you know that Maplin's sells Centronics IDC connectors, Dave? With
these and a length of ribbon cable you can make up your own with no
soldering at a cost of around a fiver each.

6303. Cubase Audio Problems

Newsgroup: comp.sys.atari.st
Date: 1998-09-18 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6tt1on$osj@enews2.newsguy.com>
Source record: 93641

This post is in response to CAF (Cubase Audio Falcon) problems Brian Becroft (brian@tos.pl.net) posted about recently. I've also corresponded with Brian via e-mail about this, but thought other CAF users might want to see it.

Brian had reported a couple of apparent "bugs" in the software, and I tested them, and came up with the same results as he did, and here is my summary:

-=-

I just thought I would let you know that I tried to duplicate your problems with CAF, and was able to on both counts - I'll leave it up to you to decide whether or not this is a good thing! ;^\

First of all, as a reminder to you, I have a "standard/Atari-made" Falcon030. It has had the "bass boost removal modification", and the "input gain reduction modification". However, I was told the "clock modification" was not needed on my particular Falcon - although I tend to disagree with this because of the way the Falcon tends to occasionally "freeze" the hard drive on routine disk accesses (not necessarily with Cubase Audio either). What happens is that the Falcon is accessing the hard drive (either reading or writing) and the busy light on the drive will light solid, and the Falcon appears to freeze, usually for about 40 seconds or so, after which it finishes it's disk access without further incident. I've been told this is a "clock" problem.

Anyway, I tried first to duplicate your "distorted audio on stereo files" problem. I _thought_ I had seen this happen in the past, but wasn't certain, as I usually don't record stereo tracks as often as I do (single) mono tracks. Anyway, I did a test recording (in stereo - tracks 1 & 2), and when I _first_ played it back after recording, the audio was indeed distorted, even though I knew for a fact that the input level was safely set to avoid any clipping.

I checked the audio in the editor, and the waveforms were not peaking anywhere. So as per your suggestion, I checked the monitors, and sure enough, the audio appeared to be coming not only from the recorded tracks (1 & 2), but _also_ from track 3! Well, I did a reset devices (as per your suggestion), and played the track again, and everything was as it should be. Undistorted audio from tracks 1 & 2 only.

Next, I tried to duplicate your "bombing in the audio editor after looping and moving segments" problem. This one took a bit of work. At first, I set the pointers to loop over a small section (highlighted in black), and then performed a "snip loop". Then I dragged that piece to another track, and nothing bad happened. I repeated this, and just generally moved several parts around, "snipped" and moved (and copied too). You had mentioned that sometimes the problem takes a little while to appear, so I kept going. And

eventually, on about the 40th edit, the Falcon crashed with 14 bombs; at which point the Cubase Audio screen remained 1/2 visible. I did a warm (button) reset, and then the Falcon appeared to completely "die"! (when my monitor is ON and the Falcon is OFF, the monitor displays a built in message that "no input signal is present"). Anyway, I saw THIS message, even though the Falcon was still ON (not good)! I had to turn the Falcon OFF and reboot.

So, it appears that these problems are not isolated to only the C-Lab MK-X Falcons, but also standard "Atari-made" Falcons. I've also sent your problems on to a Falcon using friend of mine to test. He uses a C-Lab Falcon030, and as soon as he performs the tests, I'll let you know. I'm guessing he'll have the same results as we have though.

My opinion is that these problems are indeed CAF (software) problems, and NOT hardware related.

I've found HCP excellent for SCSI cables/connectors/converters, they are the first people who knew what a SCA -> 68 pin converter was and explained the product to me, nearly every other vendor I asked seemed to think there were SCART connections used in SCSI.
Nice people too.

FWIW I had similar problems with NetBSD on a Falcon, except that the light
stayed on *forever*. :(The same kernel is rock-solid on a TT; opinion seems
to be that Falcon SCSI is inherently flakey.

Steven Cook <steve@babcom.u-net.com> wrote:
: Hi,

: My SM124 died recently after 10 year's service. After taking it apart I found
: a blown capacitor (2.2uF 50v non polarized) which I replaced with a higher
: rated (100v) but physically smaller part. This worked fine for a few hours
: then blew again. I have a schematic but cannot see what might cause this cap
: to blow - can anyone help?

Had the same problem myself. In one word, the problem is heat. My solution
was built up of three polycarbonate capacitors adding up to the same value, on
long leads, tossed up towards the front of the box. No problems since then.

Heat from the nearby heatsink killed the first one, and you can see what
killed the second smaller one by carefully putting a finger on it.

Best Electonics has the exact replacement, which should last exactly as
long as the first one did. Any large plastic capacitors are non-polarized,
and will last as long as forever does.

Unmodified ST will only connect at 14.4. A modification to serial port will allow up to ISDN speeds, altho I'm not sure if there are any ISDN modems for ST. Mod less than 20 ukp. Any Hayes compatible external modem is fine, not sure about 56k modems and ST. Lots of excellent connectivity software; main browser is CAB (supports frames, animated gifs, forms, cookies soon but not any of the fancy stuff inc javascript - no jscript compat atari browser as yet). Lots of good email, ftp and usenet clients too. Connect with STING, STIK or PPP-Connect. A number of ISPs profess atari friendliness.

I was on-line very happily with a 4 meg STe using STING later STIK and CAB 2 and ANTmail for email (eh ... until I got my wintel box ... sorry everyone) for 18 months. Its not fast and in my case not colourful but hey it was great.

UIS version 3.32 works fine on my Falcon. I'm currently using Selectric, but every once in a while I go back to UIS III. What version are you using?

And PageStream 2.1 and now 2.2SE both work fine on my Falcon as well. When you switched over to the Falcon, did you keep the same hard drive? Maybe some of your directories have changed slightly and PageStream can't find it's files (fonts for example)? Also, I have a ton of fonts on my system, and it takes quite a while to load on my 14meg Falcon...

Are you running HSMODEM on your Falcon? You should get SERIAL.CPX too - it's better than the old MODEM.CPX, and you should set you serial port speed to 38,400 or 57,600 bps. And make sure you have it set to "MODEM 2" when using a Falcon.

Also, you didn't mention if you are using STinG or STiK, or which version of CAB you've got. A little more information would be helpful.

You pretty much described this tech accurately! ;^)

He worked for an Atari dealer in Glendale California called Alternative Computing (formerly The Computer Network). He really knew his stuff - quite the Atari expert. When he was performing the other mods, he tested my Falcon and apparently determined mine was ok from the factory (although now I'm not so sure he was right). He had told me that he'd done a lot of these fixes before too, so I think he knew what he was talking about. Besides, he would have made more money if he did it! I'm thinking he decided it worked good enough with Cubase Audio (which was why I was having it "fixed" in the first place), and it does. But I guess there was more of a problem than just that...

>Another mod that Atari did was to cut the clock trace feeding the DMA

Well, there's no denying you know your Falcons much more intimately than I! Did you used to service them?

My only trouble seems to be the occasional "pause" during disk accesses. I am getting the NEMESIS board very soon, so what should I tell Alex at ATY computer to fix when he puts that in?

>MyMAIL is taking the settings in DEFAULT.CFG if the user did not set anything
>in "User & Server settings".

Well, I put all the required information into the "User & Server Settings"
first, but it didn't work until I _also_ added the info to my STinG
DEFAULT.CFG file. Before I added it, (even though I had all the information
set up in MyMail's "User & Server Settings") I got the following error message
when trying to check for mail:

"pop(): POP_USERNAME not set"

With the information in the DEFAULT.CFG file _and_ in MyMail itself, it works
though (strange...)

>It's correct.
>The font selector is there but not all functions is finnished.

Alright then, not a problem.

It's a very nice piece of software Erik! I'm very impressed. It has a very
clean and modern look as well. But, is there a way to use an external editor
for writing mails though? You editor is nice (with different colored text for
quotes and such) but I just prefer QED to just about anything! :~)

I'm using ICD 6.5.5 and it usually hangs for about 30-40 seconds.

>You absolutely MUST do one of the clock modifications to get it running
>at it's best. The one that was required in my Falcon was number two on

It rarely happens with Cubase Audio - probably due in part to the fact that
it's only in 2 color mode. But my usual operating mode is 640x480x256, and it
happens more than I would like.

>Summary: It's a bug in the Falcon hardware and NOT a bug in Cubase
>Audio...

I knew this (SCSI "pausing") was caused by problems with the Falcon hardware.
I never blamed Cubase for it.

BTW: When I get the NEMESIS board, is this bug resolved???

>so with Popgem and POPwatch, these use the POP3 servers (hence the names).
>As Erik's already explained, this can be set in the users def info.
>BTW, you can set up a POP3 thing in Newsie as well. Look in the configs.

As I mentioned to Erik, I _did_ put the information into the "User & Server Settings" _FIRST_, but MyMail would not work until I also added them to my STinG DEFAULT.CFG file. When the information _wasn't_ in the DEFAULT.CFG file, and I tried to check mail, I got the following error message:

"pop(): POP_USERNAME not set"

(even though it _was_ set in MyMail itself)

Once I put it in the (STinG) DEFAULT.CFG file (and in MyMail itself), it worked. Don't ask me why? :^?

And I know about setting the POP server in NEWSie and POPwatch - they've been there from the beginning. :^) That's never been any problem.
POPGEM however, requires it to be in the STinG DEFAULT.CFG file (as you must know)

>Again, Erik jumped in before I did, but I don't follow these lines

Oh. I didn't mess around with it enough at the time. The fonts do show up in the editor, but they didn't in the program's windows & dialog boxes and such.

>I only fetched an early version when it was announced and it didn't do
>much here... To tell you the truth, I forgot about it. Looks like I've got
>stuff enough for the next couple of weeks to fool around with...

I've got POPGEM working, but haven't messed with it much yet. I like POPwatch, and the way it puts the mail right into NEWSie. I don't think I can do this with POPGEM, and since I'm still using NEWSie, I don't know how useful POPGEM will be to me. But it does have a nice look to it (much like MyMail).

NEWSie and POPwatch are sort of spartan in their appearance, and POPGEM and MyMail are very graphically / iconally (is that even a word!?) "pretty".

>Well, like I said, I still play around with it. Right now I've got Okami

>onto the bottom part of MyMail's edit window to attach a file didn't work.
>Need some more time on that part, but according to the docs it should have
>been a matter of just drag 'n drop...

Hmmm... I'm debating the whole Okami thing. It does seem like there are good and bad things about it, and it sounds like a lot of work to set up too...

And MyMail looks great (but I'd rather do my editing with QED).

And I really like the nice SPAM filter in POPwatch. But with POPwatch I always get a timeout when I have too many e-mails waiting (or large attachments)

And I like the way mail/news/ftp are all integrated in NEWSie, but there's that potential for drive corruption - although I'm doing ok with that so far...

It's nice to have so many choices on this so called "dead" platform, eh Louis?

Hi there Mike,

I did take your suggestion and I did get a copy of Selectric. I do find it alot different than UIS III to which I have been using since the first day, however though I do think with time that I will grow to like it as much. I also tried loading PageStream again and it actually took 13 minutes for it to finally show up on the screen. YUCK! YUCK! After removing all but 4 different fonts it too a mear 7 minutes to load. Sheesh this is the pitts. I guess that I will continue to run it only on my Mega STe's. Even with all the fonts loaded its only takes a few minutes on the Mega STe. I guess that sometimes progress isn't always a step in the right direction. Now if someone could explain to me why the dialer for CAB only connects at 9600 baud when the CPX files is set for 19200 ?????? Amazing thing this Falcon seems to be! Again thanks for all your suggestions and help

Hi,-
does anyone know what`s new in the latest CAB version 2.7a.?
Is it worth the time for downloading from ASH Mailbox system?
How much better than 2.7 is it,- what improvements, if any?

Is there any major diffrence between PPP 1.4 and 1.5?

cheers

It's a matter of just drag & drop, at least on my System. It really works perfect. The same for read/view attachment. Just drag & drop the attachment to an approciated prg and up you go.
It can be even easier in conjunction with Thing or Jinnee.
On my system for instance I've installed Cab as an application for *.htm, *.html, Imagecopy for *.jpg, etc..
So whenever I double click on an attachment on the bottom part of the edit window of Mymail the approciated application starts and display the attachment. This is really a nice feature of Mymail.
Okami can do this for Mime decoded message which contains *.gif and *.jpg pictures.

I only wished that Mymail did work properly with mintnet/gluestik.

Hi again Paul,

sure is... you don't do that in 5 minutes. But again, it DOES have some
potential...
>
>And MyMail looks great (but I'd rather do my editing with QED).

Jos attended me on the fact it won't put its SIG right into the msg. Haven't
checked it myself, but I know there's some kinda convention the msg has to
have two -- chars on a line, then the sig and the final line must contain
one single "." char. Maybe MyMail is not doing that correctly. BTW, I've
tested out the attach stuff in MyMail again and it was working OK now.
Must say, it really LOOKS nice, all those animated icons. It's only they're
not all that clear... I really do need the Bubblestuff to find again what
they're intended for :-) Probably a matter of time.

>And I like the way mail/news/ftp are all integrated in NEWSie, but there's
>that potential for drive corruption - although I'm doing ok with that so far...
>
As you can see, I'm writing this one in Newsie again :-) Rite now I've got
Newsie still running for CSAST (disconnected all the other ng's in it) plus
the binaries groups, Okami for the regular stuff and Firenews for evaluation
purposes (yup, another one to fool around with...)

For E-mail that's Okami again, Mymail, and of course Newsie has the feature
too. All in all my Internet-Group in Thing is filling half my desktop :-)

>It's nice to have so many choices on this so called "dead" platform, eh Louis?

Attaboy! Now do something about your editor. It's probably formatting
all paragraphs automatically when it loads a file, causing the quote
chars (`>') to be scattered all over the place, instead of leaving
them neatly at the beginning of lines. There go my text effects!

This is port speed I assume. You can actually use 115200 as port speed?
My system gets unstable with any other port speed more than 57K ...
lot of dropped packets => virtually unusablbe system. Main problem is that
if you move mouse during modem trafic it disturbs modem and those pacets are
lost *if* port speed is more than 57K ...

Possibly a GDOS SLM driver or could be an HP laser driver. You could try loading the file into a binary file viewer and seeing if there's any clues by the way of text strings.

>I've got another folder named SLM_LASE.R that also has a bunch of
>fonts and two sys files, LASERJET.SYS & META.SYS.
Laserjet.sys is an HP laser driver (useless for your SLM laser)
Meta.sys is the driver for creating GEM metafiles from programs like EasyDraw or Kandinsky.

>Also in the Pagestream folder, the drivers folder doesn't have
>anything, but in the printer folder it has SLM804.PRT and

The SLM804.PRT is the one you want (the other you mention is for some 9 pin printer that Atari sold at one time). I think that you have to install the Diablo emulator that I mentioned in my other posting to use that SLM driver in Pagestream, but I could be mistaken.

6329. FS STe system (US)

Newsgroup: comp.sys.atari.st
Date: 1998-09-19 00:00:00 UTC
From: gwestndrf@aol.com
Message-ID: <19980919114000.HAA02269@ladder01.news.aol.com>
Source record: 93550

I have the following items for sale. I would much prefer to sell these as a complete package. Will consider offers on individual components, if I can't sell the package.

1) Atari 1040 STe (FM) computer
4 Mb RAM, TOS 1.06, 720K floppy, mouse, owner's manual, box

2) Atari SM124 monochrome monitor
original box

3) Host adapter/HD/SuperCharger package
Mini-tower PC case with power supply & fans
ICD AdSCSI ST host adapter (may be Plus version), manual & disks
Seagate ST296N hard drive - 80 Mb - 5-1/4", installation guide
Quantum P40S - 40 Mb - 3-1/2"
SuperCharger (IBM PCXT emulation) - 1 Mb, manual & disks

4) Spectre GCR (Macintosh Plus emulation)
128K ROMs, manual & disks
90 disks of assorted Macintosh software

All items are clean and in good working order. Both the SuperCharger & Spectre GCR are setup on the hard drives and ready to run.

All cables are included, except for the floppy cable needed for the Spectre GCR. I need it for the ST system that I am keeping.

The disks for the SuperCharger & Spectre GCR are not the originals. I bought both items used and the original disks were not provided with them.

Buyer pays shipping costs. Payment by money order, cashier's check. Will accept C.O.D. if buyers prepays shipping and C.O.D. charges.

Due to problems with past deals, I am only offering these items to buyers with continental United States addresses.

Asking price for this system is $300.00. Please reply via e-mail to Gail at gwestndrf@aol.com.

Have you set the fast load flags on all of the files?

6332. [ANN] CoMa Voice/Pro 4.7.0 (Communication Manager)

Newsgroup: comp.sys.atari.st
Date: 1998-09-19 00:00:00 UTC
From: Hartmann@ThePentagon.com
Message-ID: <1dfbhj5.hkb2q31oslc2uN@stardust.isdn.cs.tu-berlin.de>
Source record: 93553

```
Programme-Name: CoMa for Atari Voice/Pro 4.7.0 (COmmunication-MAnager)

Purpose: fax & voice-mail-system, to send & receive fax,
answering machine, mailbox & terminal with internal z-modem

Programme-Type: Shareware / Crippleware

Author: Siegfried Hartmann

Requirement: Computer with MagiC[Mac|PC] or TOS

************************************************************************

CoMa has the following common functions and attributes in all levels

- english documentation
- fax-class 2 & 2.0
- polling (send poll-request-tone only with class 2.0 and some class
2-modems)
- network-capable fax-job-management (3 jobs in 24 hours)
- Serial fax
- Display of the calling-number with ISDN-modems
- Display of call units with ISDN-Modems
- internal editor
- incoming pages are displayed during fax-reception !!
- text can be mixed with graphic-logos and signatures
- fax-voice-data-number management, including groups
- management for incoming fax/messages/mails
- administration of 8 telephone companys
- zone- & and time-dependent selection of telephone-company
- mailbox with internal send & receive-z-modem
- terminal mit internal z-modem

* * * * * * * * * * CoMa Voice (additional) * * * * * * * * * *

- Answering machine for ZyXEL, Creatix, Elsa/TriStar,
Sportster VI/Voice/Flash and Smarty/Cybermod, kik & Lasat-Modems
- Day & time programmable answering messages
- Multiple outgoing messages for several ISDN-MSN
- Time dependent redicrection of incoming calls
- Remote control / recall of new received faxes
- Recall of 7 special messages by DTMF-code
- Real time decoding of sound for Mac/Atari-Soundsystem of ZxXEL
ADPCM3/ADPCM4, Smarty/Cybermod u-Law- & Rockwell ADPCM4-Sounds
- Wave-Sound conversion in ZyXEL- & Cybermod- & Rockwell-format

* * * * * * CoMa Professional Version (additional) * * * * * *
```

- fax- and voice-on-demand-system
- any amount of messages via DTMF tone recall is possible
- each category can contain up to 100 messages and/or 100 fax-pages.
- statistic of category recalls
- first-level- and second-level-messages can be put together from multiple voice-files.
- for the mini-mailbox you can assign personal passwords and download-folders to as many users as you want
- personal message for each caller, who has an entry in the numbers-list (with ZyXEL Elite & MicroLink ISDN, if caller MSN is displayed)
- unlimited fax-jobs
- Faxtransmission via polling request (DTMF-PIN not needed - only for Class 2.0 modems)
- permanent poll-sender possible (caller gets fax pages even without sending a poll-request)
- time-dependent messages for 10 MSNs for ISDN
- connect-mode can differ for each MSN

* * * * * * * * * * * New in CoMa 4.7.0 * * * * * * * * * * * * *

- New preferences-dialog for zone- & and time-dependent telephone-companies
- Remind date for every Calls-Entry
- new modem Blatzheim BM-33k6/ISDN
- If "Never" is weekday the timeslot will be ignored
- Mailbox output in German or English

- various bugfixes

****

Hi

I'm not sure about pstream and UIS, however as far as CAB is
concerned. Get the latest OVL. Also, I had problem with the 1.15vers
of Sting and went to the 1.12 and have no problems. You must use hs
modem to access the higher baud rates. Youalso only need the
drivin.prg, and scc.prg for the falcon. You don't have to change
configs. Also in the cpx module that came with sting set it to 56k.
In the STing configuration set the default rout the port on under the
misc section. Also the Falcon uses modem 2.

I have a list of programs which work on the Falcon, and I think that
pstream doesn't. I'll dig up that list. The falcon is a good
machine, but it has a few quirks. Once you get cab up and running and
cruise the web in 256 color, you'll be happy.

B.P.

Yes, but only in monochrome. I have to drop it to 31200 in a colour
mode.

BTW I've now found out how to get the modem to report the line speed!
I'm getting 31200 line speed with a 115200 port speed.

Caused by comments like yours below.

>
> The ST OS is very stable
>
> The Amiga OS is not

You seem to forget that Amiga OS was the first pre-emptive multithreaded
multitasking OS there was for a home computer. Something Mac OS hasn't got
(even the iMac), PC have only just got in recent years and Atari, well,
TOS/GEM is a mess.
Amiga OS is widely known to be very stable, and efficient.
Sure, 1.3 was fairly unstable, but so were the first incarnations of TOS.
WB2.05 is more stable then any Atari OS today.

>

I agree here. If you wan't MIDI get an Atari but for MODs I'd go Amiga.
They just seem to sound better, and there is a great deal of free/easily
obtained software for the Amiga. Check Aminet, it's packed full of free,
quality software.

:) Alex will fix you right up. If there is a fix to be done, he
already knows what it is and how to do it. It's always nice for the
person working on the machine to be able to test it under the
conditions it will be used for, ie, Cubase and SCSI drive, ect.

Mike

>
> Could someone please give me the pros and cons of the both the Amiga and
Atari
> ST? Thanks.
>
Ok...

Apart from the built in MIDI the Atari ST is no comparison to the Amiga.
The Amiga has better sound quality with software controllable
filters,excellent graphics, stable multitasking OS, easily upgraded, has a
large free software server (Aminet), can be used for video effects and
titling, and performs better despite having a slightly lower clock speed.
Due largely to it's efficient, multitasking OS and custom chips which can
operate independantly of the CPU.

The Amiga supports MS-DOS file system, even with the earliest Amigas
(A1000, A500) with CrossDOS software or free utilities from Aminet.

Besides, a MIDI interface is cheap and easy to build for the Amiga, and the
same for a sampler. If you're handy with a soldering iron you can build one
yourself very cheaply. Find the schematics on Aminet.

If you consider the A2000 up, you have 11 expansion ports to play with. You
can also add a 16 bit soundcard which can be bought new fairly cheaply,
depending where you are.

With the Amiga there is the added benefit of owning machine which is still
supported by third party hardware and software companies.

If you have enough cash you could get yourself an 060 accelerator for
A1200, A2000, A3000, A4000 and play Quake online.

Many excellent browsers are available commercially, with Netscape being
ported as well as Opera.

Another benefit is that an Amiga can emulate a Mac faster then a real Mac
(software emulation, with comparable processors) so the 680x0 Mac software
market is available to you also. Multitasks and filesharing between Amiga
OS and Mac OS.

Software PC emulators are also available, even for low specced machines
that offer usable performance levels.

Big box Amigas (A2000, A3000, A4000) can utilize PC bridgeboard up to 5x86
performance level, and run concurrently to Amiga OS. (Controlled by Amiga

OS)

The earliest Amiga (A1000) was superior to the ST in almost every way.
Nothing has changed since then...

Regards.

Did you set the FAST LOAD bit on PageStream? (this makes programs load much
faster)

You can do this with a program like MaxiFile III (I set this bit to "ON" with
all my AUTO folder/ACCessories for a much faster boot time!), and I believe
Erik Hall has a little program to do this as well on his website:

http://www2.tripnet.se/~erikhall/index.html

*Look for a program called "FASTFLAG".

I have at least 420 font files in a couple of directories for my PageStream
2.2SE setup on my Falcon, and it only took 1:25 to load (I just timed it).
There is no reason it should take 13 minutes to load!! How many font files do
you have?

With regard to your connect speeds, what serial port fix are you using?
HSMODEM?
FAST_SER?

>Have you tried with POPGEM 2.1?

Thanks for your response!

Well, If there is a large attachment (even if it's the ONLY e-mail on the server), POPwatch will timeout, and NEWSie will take a very long time with it, or sometimes not show it being there at all.

Or, if there are say 6 mail messages waiting, and one of them has a small attachment, POPwatch will also timeout without showing me any headers, and again, NEWSie takes forever - sometimes not showing the mail either.

And I recently had similar results with MyMail.

As I mentioned before, after this, I have to use a term program and log onto the ISP's "BBS/shell account" to even SEE my mail (and retrieve it).

I just set up POPGEM 2.0 on my system (I'll get 2.1), so the next time I have problems with POPwatch, NEWSie, I'll try it and see what happens. By the way, it looks to be a very nice program!

It's on but I didn't check it. I'm thinking all it's going to tell me is the same message it shows me when this happens "User timeout expired".

I'll have to send myself a large file attachment and run some tests.

Thanks for your input.

Atari vs Amiga .... it's a long story ;)

It's true that the Amiga is a very powerfull computer, and I might add that
it is still handled by a firm. You can install Linux or AmigaOS, and there
are very good graphic applications. BUT I think that I you are musician
the Atari computers are really better. They've got excellent sequencers
(Cubase, Notator, Logic ...), very powerfull soundtrackers (Digital
Home Studio, Graoumpf Tracker ...), lots of synth editors etc etc.
It's also a very good machine to learn programming : MiNT is very close
to Unix/SunOS/BSD, GEM (graphic environment manager) provide very good
user interfaces and is not really complicated to program. There is also
Linux, and many good graphic applications (but the limitations were
due to Atari machine, but nowadays Atari compatible machines such as
Hades, Milan, Phenix ... use standard PCI video card that supply very
good resolutions).
As far as I'm concerned, I had to choose between Amiga and Atari a little
more than 1 year ago. I finally choose the Falcon, and I'm now convaincted
that I've done the right choice :)

Sorry I've not responded to your email quicker but I've had lots of other
things to do, being summer and all.
I've just made a change to POPwatch to allow the timeout values to be
changed, but it's not publicly available yet (I've only just done it).
If you'd like it then let me know.
It really sounds like a problem with your mail server. I suspect it reads in
the whole email when retrieving information and not just the header.
Unless the header of your offending email is extremely huge, I can see no
other reason for this delay.

This is a little bit off from this message but has to do with the
thread. I have an old Atari magazine that covers a "preview" of the
Falcon in its early days. At that time, the project was code-named
Sparrow. I'll have to dig that mag out and look it over again. It
only lasted about 6 issues or so. I believe it was formed by a splinter
group that broke away from ST-Informer.

Later... ;-)

6352. Re: Atari or Amiga

Newsgroup: comp.sys.atari.st
Date: 1998-09-19 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de
Message-ID: <199809190000.a28354@lu.maus.de>
Source record: 93573

Hello Mikhol74,

m> Thank you all for your responses. I really appreciate it. To answer
m> someones question, I would like to use the computer for BOTH graphics
and
m> music. I suppose, music would be the priority of the two. Which Atari
ST
m> models would be good for these things, 520, 1024, or what?
If you want the computer for "real", professional music with any MIDI
instrument, you can start with any ST with 1 MB minimum (but at least try
to
get one with 2 or 4 MB) and a monochrome monitor or a Multisync monitor,
which is a colour monitor, but capable of the Atari monochrome mode (and
of
course colour modes too) and a software like Cubase. Nearly the whole
techno
movement and many many other "normal" musicians, music groups and music
studios made their hits with such an equipment during the last decade (not
in
USA - of course at least except Mike Oldfield ;-), but in Europe - if you
you
know the different computers, you can sometimes even recognize it 8-),
because the musicians used "typical Atari sounds" like the keyclick (AFAIR

you can here it at least on the *very* (!!) recommended techno CD "Stellar

Supreme" by "Cosmic Baby") or the SAM ("Software Automatic Mouth - a
speech
synthesizer for different computers from C64/Atari XL up to Amiga/ST -
which
you can hear in the techno version of "Das Boot" ("Maximum velocity") or a

top hit of Falco).

It's the cheapest one, but you can forget graphics (you can produce them
(slowly) - i.e. with the POVRAY raytracer - but you can't nearly watch
them
at the quality you can produce).

The graphical best "standard" Atari is the Falcon (which is even sold
today
as "Falcon MKII" not by Atari, but by a German music software company),
which
is also very strong in audio manipulation (or exactly: Strong in data
manipulation - you can choose which data to manipulate in realtime, audio

data or visual data, which gives also great effects and much power for graphics). That means, the Falcon can handle, record and arrange MIDI data

(just like the other ones), but in addition, you can *directly* handle, record and even manipulate samples and any sort of audio input in *realtime*
(i.e. you plug a microphone to the Falcon, speak/sing/... into the microphone, with the Falcon, you pitch the voice higher/lower or distort your
voice or give echo or ... and out of the speaker, you get not your input, but
the manipulated input) - nothing to wait on!

Of course you can just record any audio source and combine it with any MIDI
source to mix it in a sequenzer like Cubase Audio (notify the difference between Cubase and Cubase Audio!). The result is a top arrangement, which you
can just put on a CD and give it away :-)

m> Also, can the ST be used to get on the internet (what kind of modems can be
m> connected to them, external PC-type modems, or what?)
No problem at all (at least, "old" Ataris have to use a software patch for

higher baud rates, or even a hardware bugfix - but that's well known). Use

standard modems, use standard printers, use standard hard disks/exchangeable
media/CD writer/scanner (with SCSI connector) and use standard monitors ("VGA-
Multisync"). Than you will have fun with these devices as long as you use

any computer (or even different computers at the same time :-)

As I wrote, connecting an Atari to the internet is somewhat not "plug and

play", but on the internet you can find detailed information how to manage it
(at least in this group, I suppose ;-).

A used ST is *very* cheap ("peanuts" as we say ;-), but I don't know, what an
used Falcon (with built in hard disk) is costing. Anyway, it depends on your
needs and wishes and money you can spend or want to spend ;-)

It's not that it's abandoned, far from it. The reasons there haven't been any updates are three actually : First the stack reached a state of being pretty stable and relatively bug-free, so frequent updates aren't that important anymore. Second, I became horribly busy with other stuff for several months, so hadn't had the time. Then STinG saw extended internal changes meanwhile which required quite a lot of work.

> I personally wrote Peter 2 emails explaining

When was that ? I cannot remember any recent mail from you. I usually send a reply pretty soon, so if you didn't receive any, maybe your mail didn't get through.

> and similar browsers are. Are there any gimmicks that I should particularly
> avoid?

Avoid Java and JavaScript. That's all. If you wanna be particularly friendly
even to the many monochrome surfers, don't use colors (i.e. stay with the
default settings of the browser, see my web page as an example). For machines
with little computing power it's good to restrict to small and few graphics
(again, see my web page), but always add the "alt" tag to the "img"-Tags
importing the graphics.

> quicker that way. Are JPG and GIF images prohibitively demanding for ST

You can use both. Large JPGs will cause delays on small machines though since
it requires a lot of computing power.

> surfers? Is there any degree of JavaScript support in CAB?

None.

Hello there,

Has anybody had any luck playing this game on Winston or Pacifist? I am trying it with both the original gamedisk which I got from denialofservice.com (a german version) and also Automation 89. In both emulators, the mouse pointer is not visible, rendering the game somewhat unplayable. I suspect that this is because the game has a custom mouse pointer, in the shape of a starfleet logo. This is the only problem and it works fine apart from this.

I used to have this game on my original ST years ago, but stupidly saved a game to the disk, which made Mr Spock appear with the caption "the Enterprise has self-destructed due to a computer malfunction" after about 5 minutes of every new game. This in itself was quite amusing because normally he would also say "I never will understand humans" but since this time the program was busted he said no such thing.

Well any help much appreciated,

Alan

Hi David,

Regarding the really s-l-o-w loading time of Pagestream 2.2 on a Falcon: Have you tried "Warp 9"? It really speeds things up. It affects screen redraws and text loading, or something like that. It was explained to me by a retired Atari repairman here in Seattle, but I forgot the details. I believe NVDI is very similar - supposedly even better. Warp 9 costs less, and has a nice mouse accelerator. A question for NVDI users: does NVDI speed up Pgstrm loading?

ANYWAY (get to the point, Clayton!), without Warp 9 on my stock (TOS 4.04) Falcon, it takes Pagestream 2.2SE 1:04 to load. (Yes, I do recall that my ST loaded the same program faster...hmmm.) WITH Warp 9 it takes 2-1/2 seconds (!). With Nemesis active it's a tiny bit faster at 2 seconds. I'm using all the fonts that came with Pgstrm 2.2SE (the last commercially available version) plus a few I had lurking around on my hard-drive.

Best regards,

Clayton Murray

I just purchased a Quantum Fireball 3.2 Gig hard drive. Am using HD Driver 7.5 and this is connected to the SCSI port of the computer. The problem that I seem to be having is that the hard drive formats ok and than I can partition it, but when I go to write the driver to the disk it come up with an error something lik, "No Suitable Partition found". I have tried several different partition formats and all do the same thing. I even tried a Conner 540 meg hard drive, it ends up doing the same thing. Anyone got any ideas what the hell is going on with this? Strange things that these machines are!

thanks in advance Dave.....

>1) UIS III
>2) PageStream 2.2

Don't know about UIS but if you'd previously run Pagestream on a mono system you'll need to delete or rename its inf file in order to have it display propery in colour.

[later - I see that your problem is slow loading. Use the tip about setting the fastload flag on the drivers etc, remove any that you don't use]

>Programs which no longer at right is ones like CAB it tends to lock up alot
>during information transfer.
Should be fine on your Falcon.

>The dialer no longer will connect at 19200 (connects at 9600) though the
>modem.cpx is set for 19200. This all worked fine before switching to the
>falcon.
Use Peter Rottengatter's STinG package to connect with the accompanying serial.cpx to set the port speed (I have mine set to 115200 and get consistent 33600 connects with CiX).

Also install HSmodem in your auto folder (drvin.prg and scc.prg in that order - followed by sting.prg or sockets.prg if you're using PPPConnect).

>Also when using MaciC 4 and using the dialer for CAB it gives me some error
>about not being to transfer something or another to CAB
Consider upgrading to Magic5.11 or Magic 6 which is due in the UK soonish.

>I really thought the Falcon was suppose to be a much better machine that
>the older ST's? Anybody have an idea what is going on here???? HELP
It is, but you'll have to reconfigure some things to take advantage of its features.

We should all give Peter a big "thank you" for enabling us to access
the internet. Peter there are no apologies due, you've done a great
job.

To the rest of the NG. Before anyone publically complains about a
programmer, a program, or a dealer please try to resolve the matter by
every means possible before b*tch*ng in public. We are lucky that we
still have very talented people supporting our platform and if someone
gives us something and asks nothing in return consider it good
fortune, or go buy a Windoze machine and see what you get for free.

One of the partitions has to be a regular GEM partition. That means
less than 32megs. You should make it 5 to 10 megs. The smaller the
partition, the quicker you will boot up. In addition since it is the
boot drive, you should have as little on partition as possible just in
case of a crash.

Tim,

This is a problem, no doubt. Legally, I am sure that the copyright holders are entitled to
protection. The fact that no one is publishing their work does not change that. On the other hand,
Atari software and hardware are historical artifacts that will increase in value with time. Someone
could buy the rights to software and republish it but would that make sense with so much
hacked versions available? Don't think so.

So, were back where we started. Hacked software abounds making the original product
(and the copyright that goes with it) worthless. On the plus side, original software with manuals,
packaging and disks are becoming very collectible.

One way or another, I think we will have software for our machines for an awfully long time.

Pagestream works fine on the Falcon and should not take any longer to load that it does on any other machine. Either the fast load bit is not set on the import/export modules or there is a problem in the paths. Also you should save the default font list, otherwise Pagestream will have to construct it. I can't remember if that happens as it loads. That may well account for the horrendous load times. Using MagiC, monochrome mode, Pagestream loads in about 5 seconds. Something is definitely wrong in your setup.

Hi,

I don't think so... my TT has two Trailblazers of 850 Mb, each with 4 equal partitions. My G:\ drive is a Syquest 44, set up for 1 44 Mb partition. Last is the CD-ROM, which isn't 32 Megs either...

Can't say the boot with all the gear I've got running is slow from the 212 Mb boot partition :-)

Working with Hushi here, and not the latest version too!

I seem to recall this 32 Mb limit is for very old TOS versions or something like that.

Another thing is a crash doesn't have to affect your boot-drive alone. I recall once I had this very fine terminal program "Rufus" sitting on my C:\ (it was already infamous because of its unstable behaviour) and the last action it did here was terminate with a gigantic crash. My whole C:\ wiped out and half of the D:\ drive too. All in all I had to restore around 300 megs. I was lucky to have an almost empty second drive then onto which I could copy the rest of the stuff, since I had to reformat the disk again. Don't have to tell you Rufus went straight into the can :-)

> On an unrelated note, Pat/Anna...you guys helped me once with some
> Neodesk/Geneva problems I had, so I'm wondering how you feel about
> MagiC vs Neodesk/Geneva since you've switched. Thanks in advance! ;-)

I like NeoDesk/Geneva and the combination served me well for many, many years. But, nagging incompatibilities began to crop up and I don't deal with frustrations very well. ;-)

I read about Neil Roughley's move from Geneva to MagiC here on CSAST and, having corresponded with Neil on many occasions and trusting his judgment, sent him a letter very similar to your post. I expected a "MagiC is good but nothing to jump ship for" reply but instead received a glowing endorsement of MagiC and HDDRIVER...

I lost that letter and a *few* other things during the process of backing up, repartitioning and installing HDDRIVER or I'd ask Neil's permission to repost it. Maybe he still has it. From my recollection, Neil was right on the money; the MagiC/HDDRIVER is great and I have absolutely nothing but good things to say about the switch. If Dan had the time to update Geneva I'd probably still be using it and ICD. Truth is, he has not and it was time to make the change *and* support the developers who are still supporting the platform. I decided to move and Systems for Tomorrow provided both packages promptly.

I lost some of the niceties in NeoDesk in the move to Magxdesk. For the most part, I have found readily available, although different flavor, replacements. Having Neil point me in the right direction early on made the transformation quite painless and pretty quick... although, because of the support for MagiC, an ongoing project. The biggest pain for me is getting down to a location which charges a reasonable rate for the purchase of Euro Checks. I need to get several things registered! ;-)

Geneva/NeoDesk is still bootable on my machine and I do still use it; thanks XBoot. Running Hard Disk Sentry and being able to easily reorder directories comes to mind. But, that occasional use is it. I'm totally committed to and comfortable with this move. Honestly, the recent APPs do run better under MagiC/HDDRIVER than under Geneva/ICD IMO.

If you have any specific questions, please feel free to ask.

While I have your attention, I thought I'd ask a quick question.

Is there any reason why POPwatch can't automatically disconnect
following a MANUAL Retrieve? The autocheck function won't work while
connected and invariably, immediately after a long download (I
subscribe to several Maillists) I have to listen to the Autocheck Error
Bell while busy in CAB.

Your number one fan! ;-)

Thanks,

Pat

"The Atari A to Z" Book Shareware ASCII Text Release

Jargon, terminology and acronyms are the staple diet of any professional, technologist and hobbyist. The world of computing is no exception and to the uninitiated home or small business user, magazines, manuals and books can be very daunting. Written by someone who understands these frustrations and needs, "The Atari A to Z" isn't just a convenient encyclopaedia of modern computer terminology but a specific reference source of material pertaining to Atari computers for the ST, TT and Falcon enthusiast.

Whether you play games on an ST, run your business on a TT, or write music on a Falcon, this book is aimed at helping you get to grips with those magazine articles that are more perplexing than enlightening. In here, you will find many explanations, mini-articles and a plethora of other miscellaneous bits and pieces to help you gain a better understanding of your Atari computer. The material in this book was written with all Atari users in mind. There are simple definitions for the uninitiated and technical data for the experienced. You take what you want, when you want it. "The Atari A to Z" is a valuable addition to any Atari user's library.

These book files are direct ASCII conversions of the Protext files used for the fifth printing. Some typographical changes have been made to keep within the bounds of the Atari character set. Tabs were replaced with spaces. A carriage return and line feed terminates each line.

There have been some minor textual changes and some updates and revisions, especially in the Appendices. There are 2,239 entries, 101 tables and 128,000 words here.

"The Atari A to Z" book text files package is shareware and costs a minimum of 5 UK Pounds. Details are in the accompanying files.

These files and all my other software including PROFILE 2 - *THE* System Analyser are available on my web site:

6384. POPwatch 2.80 released

Newsgroup: comp.sys.atari.st
Date: 1998-09-20 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <3604fdac20dfe10@the-gap.demon.co.uk>
Source record: 93420
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

POPwatch 2.80 is now available from my web site (see sig).

The following are changes since 2.73:

v2.80 20/09/98
.Resources from previous versions will NOT work with this version.

.Connection and Data timeout values can now be changed via the General
Preferences window. Defaults are 60 and 30 seconds respectively.

.When launching programs from the About window, lower case drive
letters are now interpreted correctly.

.Should now set the path correctly when launching the sound player to
play sounds.

.The UNDO key should now work again.

Sorry, yes, I would have to agree. Especially as PC's are so cheap these days and much software/hardware can be bought for the price of an 060 accelerator. Still, If you already owned an Amiga (or Atari for that matter)...

Oh, and I personally think Quake sucks, but just my opinion although I can't be the only one in the world :-)

Regards,

Clockmeister.

Well, I am posting from work...

> The multitasking of AmigaOS is in no means stable, for it totally lacks
> memory protection mechanisms making programs running amok able to crash
> the whole system.

Yes, but it rarely happens unless you use misbehaving errenous software.
Besides, the OS allows you to suspend the program and prevent a system
crash, and it rarely dumps the system completely. Have you used WB3.1?
NASA are using Amigas because they are so stable, but what would they know
right?

It's sound hardware is outdated since the early
> 1990s, e.g. in comparison to the Mac Quadra AV series or even the Atari
> Falcon. There's hardly any music/MIDI support except for the built-in
> 8bit Paula chip.

A soundcard fixes that. Paula is capable of 14bit, not just 8 bit. Check
the pinouts on the serial port and see where the support is. MIDI/samplers
etc are cheap for standard Amigas, and soundcards for the big box models
have the standard connectors fitted (soundblaster like).

It's graphics hardware is outdated since the late
> 1980s, according to Jay Miner.
He was talking about the A1000...

AGA are comparable to SVGA, but AGA was available on Amigas before SVGA was
available. Accelerated graphics cards allow 24bit any with any resolution
you care to use. Amigas are still widely used in video production, and
there is a waiting list for new A4000/toaster units.

Okay, thanks for your informative reply. Like you I really like Neodesk
/Geneva, but I've still got problems with it. Some programs that worked
fine under the last release refuse to cooperate under the latest release.

If I could ever get Mint setup correctly, I'd like to try it as well. Docs
are scarse and really need to be improved. Oh well, guess I'll keep trying
it.

I have to say that Jinnee looks good too. I'm assuming it wil probably
work with MagiC the best.

Thanks again! ;-)

I have a SyQuest EZ-135 that I had formatted with ICD's Pro v6.5.5 to 1 partition (134.x megs), that I wanted to use to exchange large files with a PC owning friend. I took the EZ and 1 cart to him, and Windoze refused to find it. He reformatted it under Windows '95 (rev 1), and this worked, so he copied over 100+ megs of fractals, MPEG's, etc,... When I got home though, I could not get either my Falcon (TOS 4.04) or my Mega ST (TOS 1.4) to recognize the cart.

Can anyone tell me what I have to do, to be able to have an EZ cart that will be accepted by both TOS and Win '95? (I'm sure this info. has been posted here before, but I didn't have a need then to read it)

Thanks in advance! ;-)

Hi there Clayton,

Regarding the loading time of PageStream... I currently do use NVDI 4 and also have used Warp_9. Actually I did not see any difference in the loading time with either Warp_9 or NVDI. What I finally did to get the load time to something that is toloratable is removing all but a few fonts (6 are left) this is of the originals that came with PageStream to start. There are many things that no longer work or that fails to work properly now that I got the Falcon. BUMMER!!!! I have also noticed that some of my programs load slower and seems to run slower during printing and screen redraws and the like. Maybe there is something I have overlooked setting it all up, but it seems funny that might of happened since I was using the same hard drive on my Mega STE prior to getting the Falcon.

Who knows
David

Dear Louis,
you are quite right. But how did it come to be:
I dubbleclicked on the Thing desktop the file default.grp from Newsie
to see what was in it.
But not the vieuwer came op but (what I did not see) a window of
Thing herself with in it the Thing-group info.
So I corrupted it unknowingly myself!

TOS 1.62 in my STe never gave me a problem and after using it for 8
years I think that's pretty good. The 4.01 in my F030 is a little
flakey at times, that I agree. The 2.1 in my A2000 (which I hate
using by the way) is very flakey. TOS/GEM is a much simpler OS to
use, and granted Intuition has more features, but it's hard to use
those features when your getting GURU'd all the time. That's from 6
years with the A2000.

As far as the flame wars in amiga forums, I have always been polite in
their forums, but even the simplest questions will get a few flames.
Go into the Amiga advocacy group and ask "what's an Amiga" see the
responses for yourself.

I can honestly say that in any Atari forum ask the same question
"what's an Atari" and you will get tons of helpful E-mail.

I really don't think it's a problem of the soft you use. For me it sounds
more like there is a problem on the side of you ISP.
I'm using all the those programs without one single timeout although I do
receive from time to time large mails.
BTW: a mailbox isn't very suitable for very large mails. My ISP advises
their customers not to use the mailserver for large attachments. If
possible you should better make use of a ftp-server or a webpagina.

: I need to find the original ST-Ram card from Atari, which provides
: 8 Mb of ST-Ram in addition to what's already on the TT motherboard.

If you really want a lot of ST ram, there is a way to put 8 megs on the motherboard. Best Electronics have the 1 meg by 4 chips necessary, the other chip needed is a 300 ma non-inverting buffer chip, and a 43 ohm resistor. Then, adding an 8 meg board gives 14 meg.

I have most of the chips, and wire, and skills. Have not done it yet, though.

It is not expensive. When and if done, $34 US in outlay.

Me too, for a copy of Bison.cfn. I spent a year collecting .ttf fonts
from alt.binaries.fonts, bought what may have been the last copy of
FontVerter, and spent several weeks converting them to .cfn. I have been
using Fonty to give them internal names and am now up to "C" on giving them
internal font names. I do not have Bison.cfn, but I have a thousand or so
other fonts, and if you have a name of a wanted font, I may have it, and
will e-mail it. If you have a font in ttf and no copy of FontVerter,
send it and I will convert it.

|didn't get through.

I can vouch for that statement folks. I've sent Peter an email or two... especially when I was first setting up STinG. Even if the proper reply was "RTFM" (which usually WAS a fitting answer to my questions), I recieved a prompt reply.

I'm getting faster thru-put with my TT and STinG than I do with my office's Pentium II with the same ISP and modem speed, so I'm not about to do any complaining about the lack of upgrades. <g>

Thanks for a great piece of software, Peter!

Take care,

That's why you are using a Wintel PC and Mickeysoft program to post
here, rite?

The multitasking of AmigaOS is in no means stable, for it totally lacks
memory protection mechanisms making programs running amok able to crash
the whole system. It's sound hardware is outdated since the early
1990s, e.g. in comparison to the Mac Quadra AV series or even the Atari
Falcon. There's hardly any music/MIDI support except for the built-in
8bit Paula chip. It's graphics hardware is outdated since the late
1980s, according to Jay Miner.

Perhaps you should forget these desperate penis length comparisons. A
computer, for most users, is not a penis, even when it's something they
use for work or play.

Hi everyone:

I might get a lot of negaitive responses from this BUT:
After visiting some of the sites that are meant for Atari
Emulators(gemulator)on PC, they seem to have thousands of
games available (in the .ST extension). After looking at some of
these games..it would be very hard to find these at any
commercial houses, even if they were available, so my feeling is
perhaps these"hacked" versions are in a way PRESERVING the atari
platform in a way. Now if you would find Recent titles being
hacked, so that the authors should get thier square dues,then
there is a definite reason to object. Sometimes I go to some
other Music Newsgrps and people are asking for CUBASE VST Hacked,
so they can basically get a free copy. What I am talking about is
preseving some of those Cool St games that you can't find or get
anymore.So in a way..the hackers are doing US a favour in
preserving these programs that otherwise would be lost in
software heaven. COMMENTS?

Hello William,

N> I can honestly say that in any Atari forum ask the same question
N> "what's an Atari" and you will get tons of helpful E-mail.
I think, you got the point.

I can't speak for non-german users (at least, I even can't speak for all German users ;-), but I suppose, whereas many freaks bought their computers
for a sort of "image reason" (or sort of "religion? ;->) or the computer makes one thing better as all other computers (at least, as they think), most
Atari users bought their computers just because they were cheap, powerfull,
relieable and comfortable (reasons, which aren't popular today - if I analyze
the growth of Wintel-PCs right >:->). In addition, many many Atari users always looked beyond the horizon (even many just among my own friends, including myself) and worked in friendly coexistence with other platforms

(even DOS and Windows - wasn't the Atari the first personal computer, or *maybe* the second after Mac, with a PC card to run DOS and Windows on it?)

And hey, imagine that: A long time, the most popular computer in Germany (at
home, at smaller offices, in smaller and bigger industry, at the universities), was a computer with a hebrewic (spelling correct?) system font, built by a survivor of the concentration camps, who has lost his family
there. Germany was the most important market for Atari (of course, before the
really good ST software came, the reason for that simply/maybe was, that the
Mac was so expensive in Germany, much more expensive than in the US).

But that just as an interesting footnote of the history ;-)

Greetings, Oliver

Hello Tim,

t> so they can basically get a free copy. What I am talking about is
t> preseving some of those Cool St games that you can't find or get
t> anymore.So in a way..the hackers are doing US a favour in
t> preserving these programs that otherwise would be lost in
t> software heaven. COMMENTS?
Personally, I make a difference between games and applications for
different
reasons:

1. Games were (at least in Germany) not the main interest for Atari
computers. The "gamers" bought often an Amiga, whereas the "serious" ST
user
bought in addition a game too.
2. There don't exist any single game publishers for Atari anymore, but
there
are still programmers of tools and application which do exist and which do

sell the software! Some programmers even make updates of their programs!
3. A game under an Atari emulation may be good, but it is at *no* time
nearly
as good as on the original (at least, not with *these* emulators and
especially with these Hardware), whereas an application could not only
just
as good as on an original Atari, but because of the emulation speed, it
just
could be much better (in fact, most of the time, it is better :). So a
application or programming language can actually compete in some way with

it's PCs and Macs counterparts, even if they are emulated!!!! :-)) Show me
an
Atari game, which can compete with any actual PC or Mac game, and you
would
make me more than astonished ;-)
4. With ST games, no one will earn money (even if he wants to :), but if
you
use Cubase i.e to produce a song (and Steinberg is still existing and
Cubase
is still sold) and if you earn money with that, than you are a thief (same

for any other applicaton, i.e. DTP or anything else).
5. At least: Even if you can't buy the software anymore, because of
pirating
Atari software, you may came in struggle with companies, which sell their
old

Atari programs in newer versions on other platforms. But of course, if you

can work at an affordable speed with an pirated and emulated software, you

have no need to buy the PC or Mac version - so the programmer is beaten twice: He is pirated and he can't sell his new products.

Think of it.

The easiest way is to partition the EZ 135 cart on the PC and then use BIGDOS under TOS to allow you to access the cart. OTOH you could use HDriver (I think you would need version 7.XX to be able to do this).

Steve Hammond

Dave,

You can use a use it with an adaptor and software that is sold by Woller and Link. However, having used both a parallel and SCSI Zip I would really recommend selling the one you have and getting a SCSI version. Data transfer is about 3 to 4X faster.

Steve H.

I could well be wrong, but it sounds like your partitions may be too
large.

Each version of TOS has its limits on the size of partition it can
handle. You should find a list of maximum partition sizes in the
HD Driver manual.

I have had similar problems when I have tried to create large partitions
on my Falcon

Hope this helps.

The only alteration that I'd like to see would be the subsuming of the STinG internals switches to the default.cfg file - and that's only to reduce the amount of CPXs in my folder.

If you have the choice, don't get anything less than an STE. Forget the
old ST/STF/MegaST as these are much more difficult to upgrade. An
STE/Mega STE/TT/Falcon are pretty reasonable computers.

> Also, can the ST be used to get on the internet (what kind of modems can be

> operate independantly of the CPU.

True, the ST sound system was crap (the same as the Amstrad CPC, and
maybe the spectrum too, not sure). This was improved on the STE, albeit
too late, so not many applications used the improved stereo DMA system.

The Atari also had custom chips. It's blitter and video shifter were
less powerful than the Amiga, but the ST had a 70Hz monochrome mode
which was better than anything else on the market at that time.

> The Amiga supports MS-DOS file system, even with the earliest Amigas
> (A1000, A500) with CrossDOS software or free utilities from Aminet.

TOS supports it from the beginning, without any add-ons.

> Besides, a MIDI interface is cheap and easy to build for the Amiga, and the
> same for a sampler. If you're handy with a soldering iron you can build one
> yourself very cheaply. Find the schematics on Aminet.

Sure, but there aren't any sequencers like Cubase or Notator or Dr T.
Hardware alone doesn't make a computer.

> If you consider the A2000 up, you have 11 expansion ports to play with. You
> can also add a 16 bit soundcard which can be bought new fairly cheaply,
> depending where you are.

If you start comparing A2000 and Falcons for example, the Falcon doesn't need expansion ports, as everything is built in. However, you can improve it drastically by adding an Bus accelerator like the Nemesis or a processor accelerator like the AB040 or the new CT2.

An A500 has the same expandability as a 520ST.

> With the Amiga there is the added benefit of owning machine which is still
> supported by third party hardware and software companies.

Same here.

> If you have enough cash you could get yourself an 060 accelerator for
> A1200, A2000, A3000, A4000 and play Quake online.

Here you can get a Milan040, soon an 060, or a Medusa/Hades060. An Atari is not for games ;-)

> Many excellent browsers are available commercially, with Netscape being
> ported as well as Opera.

We have CAB, WenSuite, Draconis. Mozilla is said to be in the works too.

I thought Opera on the Amiga had been abandoned.

Please, move this discussion over the comp.sys.atari.advocacy. It would make a change from the usual sinclap propaganda.

Cheers,
Nick

I must admit that I have mixed feelings about this.

Technically, this is software piracy and is illegal and there's nothing
we can do about it (except asking for permission from every
programmer/graphist/musician/editor from the 80's era).

On the other hand, the software is available all over the net for free,
and there is also nothing we can do about it (except complain to
sysadmins and make formal complaints to whichever competent authority).

What I put in the Quick FAQ is more or less that: the games or TOS roms
are there, but it's illegal to use them. What else can we say ?

The older platforms (C64, Spectrum, Amstrad...) have dealt with this
issue by making the software available, with a notice to authors/editors
saying that if they disagree, the software will be promptly removed.
Again, this is technically illegal, and I haven't heard of anyone
requesting that a game be removed from the archive.

The point is one hand it's illegal, but on the other hand nobody cares.

The only people harmed in the process are, original game owners
(individuals or second hand dealers) who might like to sell their
software and find that their property has no value left because of
piracy, and current developers who find themselves competing against
80's super-production games.

Just my 0.002 euros

Cheers,
Nick

The answer is in the Quick FAQ.

There is an adaptor made in Germany, but it would be cheaper to get a
SCSI one right away.

MIDI is MIDI, whatever keyboard/computer/expander you use. Any decent
sequencer will be able to record program changes/sysex or even MIDI
sample dumps. A sequencer just records anything that come through it's
MIDI ports.

Or into an STe using an adapter which sat on top of the processor, connecting into the edge of the socket. No soldering required, but a rubber mallet came in handy.

(Mine has stopped working - I suspect that the connector has worked loose.)

Hi Ronald,

well, I you stick to the name "Default.grp" Thing always creates, it's
like calling up the Confuzer Boys... I've got a group "loose stuff" with
all kinda logfiles and this Default.grp (the Newsie one) in it just to
drag them onto my editor's icon, and Thing displays the contents as
filenames, with a G sitting in front of Default.grp, thus indicating it's
a group file... Hell, *I know it's not*, but Thing keeps on thinking it's
a group file. When I drag the one to QED's icon however, it simply loads
into QED just the same...

Note this msg is being written in FireNews since that's another one I'm
evaluating ATM and I'm just checking out the handling of more than one
message with this program, since it tells the editor to create a
"temp.msg" thing... I'm just curious whether the next one will be a
"tempxxx.msg" or the whole thing gets combined into a bigger file. Found a
few peculiar things in FireNews already, but it works :-)

CU, Louis (this one because I don't think the prg knows my SIG file)

> into this NG :-)

Well, got this one back again and it looks like it's OK. Probably the
queued files go straight into the INM and INH files. There's a few things
you should watch using FireNews: it uses an external editor, here that's
QED. Upon starting that (by clicking "post to group") an alert comes in
that says "Can't find RSC file!". I solved this by putting QED's RSC plus
CFG files into the Firenews dir. Christian suggested adding a line in
MAGX.INF #_ENV for QED, but it didn't work right. The config file is
needed again for QED to find its settings. I probably get the key later
this afternoon, so the limitations (very few) will be gone then.

Looks like FireNews is another nice program, the only thing is I still
haven't found out how to use a fullgroup-list in it. Tried to use the
NG.DAT file from Newswatch and put it in the News dir as "NG.NGP" but it
won't do a thing. Furthermore, subscribing to new NG's without knowing the
recent article-numbers is something: start D/L the articles, note the
amount of "expected articles", then disconnect, look into the header for
the number and editting the ACTIVE file looks the best way, unless you
don't mind 500 articles pouring in for every newly subscribed-to group...
But for every group you're subscribing to this must be done again :-(
Once the numbers are set correctly it's not bad at all.

And heck, I messed up the sig again by also deleting the freshly created
lines when I started editting this one :-(

Gotta watch that, Lewey!

Thanks for the reply. Is BIGDOS easy to use? I'm assuming I can find it
at most of the popular ftp sites... Thanks again! ;-)

Yes, but the old MS-DOS file system was a mess from the beginning. The 8.3
file identifier system was rediculous.
Give me long file names with software support for Mac file system and
MS-DOS file system any day.

Everything is built into the A2000 as well, but the A2000 does offer
greater expansion possibilities. You have, but are not limited to the
hardware that comes as standard.

>
> An A500 has the same expandability as a 520ST.

Roughly, but fitting an extra 512Kb on the A500 was simply a matter of
sliding an expansion card in the trapdoor, unlike my old 520ST.
There are plenty of accellerators for the A500, even the A1000 had 68020
upgrades internally. Actually, I still have an A1000 which has had a
replacement motherboard, 3Mb RAM, KS2.0/1.3, SCSI onboard with an Internal
HDD and ZorroII slot, Graphics card slot and CPU slot. Not bad for a board
bought in 1988.

Apparantly not, it's still in development. The Amiga also has the easiest
program in the history of the net to get connected. Miami requires only a
username, dialin number and password. The rest is configured completely
automatically...
IBrowse, Voyager and others are complete browser packages, and the IIRC
client is the best available on any platform. This has been widely
acknowledged by many different platform users.

Hi,

have I ever seen this name before, the last 6 months? Not that I remember.

Anyway, I reckon this NG is for information purposes... Rite, Nick has a point when I'm using it for a simple test, but we don't have that many groups here. They'd probably react with "F... off!" in "m68k", or "astronomy" or whatever. Haven't seen much on FireNews here lately, so I figure some info wouldn't harm, would it? If you know a better way of connecting to other FireNews users, I'd be extremely happy to hear from you again.

So, what have your contributions been here, lately?

And those replys are the reasons why the Amiga wars are waged forever ...

Come on, guys, you should be ready to admit that William has not idea how
a modern Amiga system looks like, and that Clockmeister (what's your real
name - you know you're supposed to use it on the net) does not know any
modern Atari system. Your both statements are pretty pointless.

This is how religions are made. Computers ain't got anything to do with
that sort of thing. So please refrain from such comparisons.

Cheers Peter

The Moniterm has a different pin out than a VGA monitor I would have to
get out the docs to see exactally what the difference is, but there is
a real good chance that you could have damaged something.

The drives spinning up indicates your getting a clock signal (ie the
COMBEL is ok), but the video problem indicates a VIDEL problem,
especially if it was working before you connected the Moniterm.
Anyway, that is one of the first things in line that could have been
damaged.
I guess that is why Wizztronics is in business:(.

Mike

Stupid comparison. Comparing a 1985 Atari with a 1995 Amiga has no value.
Compare either the first versions of both, or 1995 versions of either.
I can understand that you don't as the outcome would be much more balanced,
less favourable for your adored Amiga.

> The Amiga supports MS-DOS file system, even with the earliest Amigas

I suppose you wanna say here the Atari can't ? At least implicitly.

> The earliest Amiga (A1000) was superior to the ST in almost every way.

As usually matter of preference. A slight shift of preference turns this
statement upside down. Value good flicker free screen resolution higher
than colors ? With that point of view the Amiga 1000 was a piece of crap.

> Nothing has changed since then...

A lot has changed. Amigas got flicker fixers, the Ataris got good color resolutions. You're talking a lot of Amiga-biased rubbish.

>With Okami it's more like Read, delete (= click/click/click/click/click to
>get the flags set and move on to "next"), read and so on and so on.

You don't have to do all that clicking. Everything in Okami can be
done by single keystrokes. For instance, you can set a msg flag to
`killed' by binding the command `set-msg-flags +k' to a key.

And you can even bind a *sequence* of operations to a key. If you want
to go immediately the next unread message after you've set a killed
flag, bind the *sequence* of commands `set-msg-flags +k ; msg-go n' to
a key.

Etcetera, etcetera,

But why all this killing? You can set your expriration criteria
to always expire read msgs.

Save yourself unnecessary trouble and take your time to study the
program.

I suppose that I should throw another variable into the equation...price. What does a "decent" (music-wise, and graphic-wise) used machine, of either make, go for? In all actuality, this would be the biggest reason to buy a machine. I am assuming that the newest versions of either system would cost something along the lines of a new PC or Mac, eh? What does an Atari STE (4 megs, hd, midi, monitor, etc.) go for? How about a similar Amiga?

Most sequencer programs that you can get on an Atari will send
program changes. Of course you can use a (music-midi) keyboard,
just connect it to the atari Midi IN and connect your sound
modules Midi IN to the Atari midi OUT .have the sequencer set to
"midi Thru" or "midi Echo"(whatever the termonology the sequencer
uses)You can good sequencers off the net..Trackman..Sweet 16.

good Luck

I much doubt that number. 31200 bps is not a line speed any Modem would
connect to. You probably mean 38400 bps.

Hi there John,

Probably one of the best keyboard adaptors for the Atari is the DECKA. I do
beleive that B&C Computervision carries them. Expect them to run you about
90.00 or so. Really by the time that you add a IBM style keyboard to it
and shipping it will cost you about the same as the Mega keyboard would.
Most places that I know of charges anywhere from about 120.00 - 145.00
Good luck on you endevors.....

My Mum , bless her heart, has decided that ST games are her new hobby and has searched far and wide for games for it.

She has come across and purchased The secret of Monkey Island..I think thats what its called, but unfortunately at the beggining you need the answer to a question before you are allowed to progress any further.

This was obviously on a provided reference sheet but she unfortunately does not have this.

Is there anyone out there that can help her with this. Possibly a sheet they are finished with or at least a list of the answers.I would be extremely grateful.

Please e-mail me at the above address.

Thanks

Since there were over 2500 games made for the ST, I don't think that's
a fair statement. Most of the fun playing a game is in the design of
the game. Having CD quality sound, or true color graphics doesn't
make a game fun. If you ever get a chance, look at some of the better
games out there for the ST. Most of the ST games out there use more
than the 16 color low rez. Doom and Quake are fun, but you get tired
of walking aroundbumpingintowallsandshootingthings.

Is the 1084 a composite monitor. If so, connect pin 2 from the Mega
to composite on a rca cable and pin 13 to ground. I used crimp on
connectors, put the ends into the proper holes, and then put Play-do
all around the wire to form a block. When the play-do dries it gets
hard, and the connectors will stay in place.

I did this to my old STe and have it plugged into the TV's vidoe in.
I'm not sure if the play-do will clogg up the others holes on the
mega. Cover them with wax paper.

6483. More Queastions From The Atari Challenged

Newsgroup: comp.sys.atari.st
Date: 1998-09-22 00:00:00 UTC
From: marstech@sprynet.com
Message-ID: <6u7750$r2v$1@juliana.sprynet.com>
Source record: 93351

First, Thanks to those that help before... (thanks for the deal on the keyboard Sheldon!!! :)

Second let me say that I love these ST machines and I'm kicking myself for not pickup one years ago!

Got a couple queastions I hope some might help me with :)

1. I replaced a bad 720K drive on an ST with old 1.44Meg PC type drive and it appears to be working great... I found instructions (Via a ST FAQ) on how to do it, and part of the instructions said to "fix" the media sensor switch so it's always on because ST's media changes diffrently then a PC...It can cause problems... Yada, Yada... Ok, No problem. The thing is when the other ST's I just got, ones with working Atari Drives, start up with no disk in the drive, the drive light stay lit... on the ST with the adapted drive it goes out. The good part is that it boots (without a disk in the drive) a lot faster then the "normal" ST, Bad part is I'm getting paranoid that altering the media sensor was incorrect. So, I'm I just being paranoid, or should I get the soldering iron fired up?

2. I've got a Mega ST4 with a Megafile 30... There's a lot of stuff from whoever used it last... Queastion: What files/Drivers do I need to keep for a bar bones HD configuration? and how/where are the where autostart stuff kept on a ST hardrive?

3. The format option in my version of TOS (1.04/6 I think...) in the Mega lists a High density option in addition to the single and double... Granted I'd have put in a high density (I ain't cutting the case on that one!) queastion is would it work with a PC 3.5?

4. I've seen a few files on how to connect an ST to a VGA monitor... It sounds like it works (at least in mono), but because of the nature of the beast, it not quite perfect for color. After looking at the pinout of the ST's monitor port, I was wondering if CGA or EGA monitors might work?

5. On the joystick side of things, it looks like Commodore and Atari 8-bit joystick will work on the ST (pinout is identical)... Anyone try hooking up a koala pad to the thing?

I'd be grateful for any help!

Thanks!!

Source record: 93352

What I think, and please prove me wrong. That will make my day,
believe me, is that a standard falcon (with DSP useage) can't do
streaming video/audio. Hence no software.

you calculate an average of 2k/sec, oklet's eevn say 3k or even 4k/sec
(for those with a fast modem/connection, eventhough should be doable
on a 14k, but well).
Counting a mono at the lowest freq like 12khz sampling. See how much
it requires data/sec, so you need to compress that. Which compression?
I don't know. probably not mp3, so even your own format. This factor
of compression needs to be quite big, and the algo must be fast. The
prob is that the falcon at 16mhz is not fast enough for this
supposedly algo.
That's ALL what I think. Please prove me wrong. That's a very
interesting topic. and Will probably give hope to some people who've
thought about such things, but never went any further because of the
limitations. (If there is any limitation)

The limit even for TOS 1.00 is 256 MByte. There is no TOS version with a
32 MByte limit. The very first versions of AHDI had this limit.

Your partitions are probably too large. Have a look at the HDDRUTIL
online help for the maximum partition size which depends on your version
of TOS. Note that any TOS versions supports at least 256 MByte per
partition. There is no 32 MByte limit for any TOS and has never been.

You have to partition the medium with HDDRUTIL (coming with HDDRIVER).
HDDRUTIL and HDDRIVER support special partitions that can be used with a
PC and an Atari without any additional software. You can find more
information on

http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html

One way to check, is to launch an application from the floppy, then
switch disks around and try saving to another UNIMPORTANT disk with
files already on it. I managed to screw up a very important disk this
way after replacing my drive.

MAKE BACKUPS OF ALL THESE FLOPPIES FIRST!!!

Another workaround is to put fmc.prg (Force Media Change) into your AUTO
folder. It forces a media change each time it accesses a disk. This
probably slows down operations a little bit, but it's worth it, just to
be sure.

> 2. I've got a Mega ST4 with a Megafile 30... There's a lot of stuff from
> whoever used it last... Queastion: What files/Drivers do I need to keep for

> kept on a ST hardrive?

Well, the only thing you need is the SHDRIVER.SYS file. This makes the
drive bootable. You can access it without that file, but it won't be
bootable.

Before removing things, don't forget to back them up.

> 3. The format option in my version of TOS (1.04/6 I think...) in the Mega

A Mega should be either 1.02 or 1.04. The only TOS to list the HD Format
option, AFAIK, is
TOS 2.05/2.06 so maybe the previous owner upgraded to that.

To be able to use your HD drive in HD mode you need to perform a few
modification. You need to feed the WD1772 controller chip with a 16MHz
signal in place of the 8MHz one used for DD. Details are in the Quick
FAQ, among other places.

Nope, definitely not. It's an RGB monitor you're after, or a TV.

> 5. On the joystick side of things, it looks like Commodore and Atari 8-bit
> joystick will work on the ST (pinout is identical)... Anyone try hooking up
> a koala pad to the thing?

Yep, pinout is identical. It was an Atari standard that actually caught
on. The Koala pad would need a driver to be written, but were some
graphic pads for the Atari.

Cheers,
Nick

Source record: 93363

Hi there,

I've got an ICD interface (DMA/SCSI) and an IBM SCSI Hard Drive plugged on the Atari 1040 STE. Everything have worked fine until a couple day, I encounter some troubles : some errors while reading files (after some try, it works), some message 'reset scsi bus' .... and so on. With the ICD tool, I can only check out for bad tracks (no new bad tracks found), does somebody know an efficient tool to diagnose that kink of trouble ? Thanks.

david.guillen@skwbio.com

Hi,

Ya, with an Atari and a midi software like Cubase, you can brodcast
your program change on the midi network. I have used an Atari 1040 STE
with 4Mo Ram and a hard drive to drive my setup (SY99, DR660 and
JV1080). This way, it's feasible to automate everything.

ACK. Their products are very ok
(my AdSCSI ST works without any problems)...

> Getting hold of ICD is the bigger
> problem -- they don't answer their phones much anymore, I hear.

...but their customer service is lousy.

Probably we should point the ICD people to the NG to show them
that they have a severe problem and that the ATARI community wants
their products if only their service wasn't that lousy.
Could be a kind of "last warning".

OTOH: such an email could lie around at ICD for month...

Hello Mikhol74,

m> I suppose that I should throw another variable into the
equation...price.
m> What does a "decent" (music-wise, and graphic-wise) used machine, of
either
m> make, go for? In all actuality, this would be the biggest reason to
buy a
m> machine.
Yes, I assumed that :-)

But, I don't know - just look in appropriate groups, where people sell
things
or want to buy it.

Especially, I don't know what a used Falcon will cost. But as I said, a
used
ordinary ST (or even ordinary Amiga I supppose) just costs "peanuts".

But (as I said) if you want to use it really professional, then the
software
is much more expensive :) (but if you have later on more money available
for
a actual Mac or PC highend system, you can easily cross-upgrade from Atari
to
these platforms, because i.e. Cubase exist for either Atari, Mac and PC).

m> cost something along the lines of a new PC or Mac, eh? What does an
Atari
m> STE (4 megs, hd, midi, monitor, etc.) go for? How about a similar
Amiga?
Lower than 300-400 DM I suppose. A friend of mine told me, that he has
seen a
TT(!) for 400 DM, that would be incredible cheap but obviously not that
unrealistic. :-o

The problem on Amiga side could be, that it may be difficult to get an
appropriate system at scratch. I think, in most cases, you have to buy
additional add-ons (RAM, midi-ports, HD).

But we gave you the facts, now go out and watch by yourself :-)

> limitations. (If there is any limitation)

14.4 RealAudio is meant to be small enough to be streamed though a
14.4 modem, hence the name. Getting an audio file small is not a
problem, if you just reduce the quality enough. RA 14.4 doesn't have
very good quality at all, you can't compare it to mp3 in that
sense. Well, I'm a bit wrong here, since mp3 can have low bitrates
with lousy quality too.

I tried the RA 14.4 source posted by someone here in Linux, and it
almost decoded it in realtime with the CPU. In TOS/MiNT it might be
possible in realtime. I haven't looked into the possibility to put the
source in the DSP yet. There are a lot of tables used, and the DSP
doesn't have very much memory.

To sum it up, I do think the Falcon is capable of streaming RA.

Do any of the Atari emailer programs support the blind carbon copy function, such as you find in Netscape, Internet Explorer, Eudora, and Lotus CC:Mail? I have need of such a function.

Charles Stanley wrote that he was having no problems with Newsie .90. Wish that were true here. It's deleting messages here from the hard drive before I even read them. The messages are listed in newsgroup window, but are missing from the hard drive. I do all my reading offline.

And it's screwing around with the subject lines, too. The subject as listed in the newsgroup window many times does not match the subject line in the message itself. It's so bad that I don't trust it here to be able to read the subject list in the group listing window and decide on whether to read the message or not.

Time to move to something else I guess.

The 1084 and 1084S came out with different input connectors dependant on
the country where they were sold. But all had a composite in AFAIK.
Some had a 9 pin connector, some SCART.

And yes, they were rebadged Philips CM range monitors.
Not a bad monitor either, Acorn used that same monitor (rebadged) on some
of their computers, but did not have some of the 1084s features like
composite in.

BTW, Acorn have left the desktop market - and Phoebe has been shelved.
They cut their workforce by nearly half.

Source record: 93373

Honestly, a run of the mill stock ST can be had for as little as $5,
without accesories or around $50 - 70 with a monitor and mouse and
software.
I have not seen an A500/1Mb for less then $20 with no accesories, but the
price range for an A500 with a monitor etc is usually a bit higher then
that of an ST.
Nothing substantial though.
(Australian dollars BTW)
I do think both are good value for money at those prices...

BTW, did you guys know that Acorn have dropped out of the desktop market
and have laid off nearly half their workforce?

No Phoebe either, it's been canned.

Regards,

Clockmeister.

Well, that's what it reports. ;-)

A few other people on the Zetnet ISP have reported that they can only
get 31200 when connecting via the local 0845 number but something like
32400 on the Manchester 061 number. It may well be 38400 as you say
because the transfer rates when browsing or collecting news seem
higher than 31200 would suggest.

Hi Ken,

who was that, shouting "don't get hysterical about Newsie" again? Bug's
still there...
Well, I moved on. If you don't wanna go into the quite time-consuming set
up for Okami/Newswatch/Popwatch, I could recommend FireNews... it's an
OFFline reader only, but works decently. Works with StinG too. The URL for
it is http://www.alfaskop.net/~faltrion/FireSTorm/
Need to register if you wanna hook up more than 5 groups, but that's just
a matter of an e-mail to Christian. If you need help setting it up, gimme
a yell.

This *has* happened. RARE (previously Ultimate Play The Game) have
blocked anyone attempting to put 'snapshot' images of their old ZX
Spectrum games. Have a look for the "World Of Spectrum" website, they
have a list of people who have allowed people to post their games, and
companies who haven't - there are a few.

Dear Falcon owner,

after looking into boxes I not only found
Falcon memory boards for 14 Mb
but also

MSW-FAL Monitor switchbox v. KL&MO.
ST+VGA+vid+aud Falcon 030

They look as follows:

1 a thick cable goes into Falcon Monitor port
2 a thin wire goes to a joystick port for juice
There is a chip in the box.
3 connector 3-rows VGA
4 a switch
5 a 13 pin Atari round monitor plug mono
6 the same for color
7 two tulp-connections for sound stereo (L/R)

Any interest in this?
Let me know. I have a box full and they can go away for
'cost of production'.

Met vriendelijke groet,
Ronald van der Kamp

: am assuming that the newest versions of either system would cost something
: along the lines of a new PC or Mac, eh? What does an Atari STE (4 megs, hd,
: midi, monitor, etc.) go for? How about a similar Amiga?

"original" hardware (Ataris and Amigas) can be only bought second hand, so
there is little use in comparing prices as it soley depends on what offer
you find.

Let me add that the inbuilt SCSI ports (and ACSI ports) are IMO very
important, as you can add current SCSI devices, ZIP drives, CD ROMS etc
very easily (and I also suppose that most older used STs for sale now com
with an adapter SCSI<->ACSI

Another argument to add to the list is that AFAIK most of the Amiga
Software is very hardware dependent, depending on the original chips from
the Amiga. Graphics updates in hardware usually meant you also had to
upgrade the software with special drivers for evry single application
(e.g. Deluxe Paint- you also had to mess around with Workbench emulators
etc.)
The Atari OS design was designed in such a way, that clean OS applications
did not need to adress the hardware directly and use just OS functions.
In the old Amiga days, this was considered to be "slow". The advantage
f the Atari appriach pays off for todays user.

Atari emulators, for example, on the Pc and macintosh do only need
to get the operating system going to get the programs to work.
Moreover, all cleanly written applications can then use the
advanced capabilities of todays computers, that is: Graphics with
true color and resolutions beyond 1200*960, 70 Hz, they can use
the Macintosh/Windows clipboard for data exchange with native Mac
or PC programs, use their file systems (because of loadable device
drivers and filesystem dtivers etc.).

Amiga emulators need to emulate the Amiga not only CPU and OS wise, but do
also need to emulate the custom graphics chips to get useful
compatibility- at the expense of having less speed and only the original
Amiga graphics modes at disposal. Thus, Atari emulators are much more than
just emulators, they are somehow plattform independent operating systems,
running on most other host operating systems, while taking full advantage
of the hosts capbilities. A G3 power mac running for example Magic Mac
(the Atari OS for Apples) shpuld outperform almost anything by several

factors that says "Amiga" on it. If the Magic or GEM OS was to be ported on the Amiga (sth easily possible) all Atari applications could use all the custom features of the Amiga without adding single lines of code; Amigha software is much more restricted to original Amiga hardware.

For you this means that you can buy a used ST and be sure to be able to use
todays, futures and past software also in the future and on any other computer and take part in newer developments. Amiga programs have to be rewritten, so in most cases you will just have nostalgic feelings.

You forget, that since 1989 there are a improved Amigaline available, the
Amiga3000 and since 1992 the A4000 with a improved bussystem called Zorro
III. Both machines there absolutly stable and since ~1993 are gfxboards
the standard for the non-gamers. On the most Todayamigas the GUI works in
17" resolutions like 1152x900x64k wich will looks ond works very differnt
to that, that you know as an Amiga (500/2000).
Its the same thing to cut a Atari to the Atari 260 and look that a milan
will be at this time.

> than colors ? With that point of view the Amiga 1000 was a piece of crap.

OK, for the early generation this would be true. Since ~87??? Amigas have
a buildin socalled ECS-Denise (Amiga 500/2000) wich will do 640x400 in 70
Hz by only 2 colors. Since there is no monocrome Version of the GUI, this
modes have been never used. The only usefull thing for this modes was the
B/W mode for MAC emulators.
A better solution at this time would be a special monitor wich gives
1024x1002 in gray on every Amiga.
And last not least, there are flickerfixer wich will provide you with
640x4xx and 16 colors.

Yes an No. You have not to use the well known "crash"-Programms on the Amiga. Using of proper programmed Applikations and Games will hold your machine very stable.

> It's sound hardware is outdated since the early 1990s,

Yes and No. First, you have a CPU load of ~3 % to stress the soundhardware, wich is at this time good enough for games. You have a "hidden" 14 Bit mode in stereo wich can calibrated by hand and works better than a elcheapo PC soundcard, and last not least, you can the same thing do, that PC owners can do, you can bye a soundcard with mpeg playback and so one.

> e.g. in comparison to the Mac Quadra AV series or even the Atari
> Falcon. There's hardly any music/MIDI support except for the built-in
> 8bit Paula chip.

??? The MIDI support goes over a cheap box and the serial line, i have never heard about a connection between Paula and Midiequipment.

> It's graphics hardware is outdated since the late 1980s, according to
> Jay Miner.

Hm, The 1992er line, such as a Amiga4000 can do 1440x568 in 256 or Truecolor, it is good enough for video and presentation. Due to the lack of proper Screenrefreshrates (for my subjectivity refreshs lower than ~85 Hz are unusable) today Amigausers have a GFX-card in the box.
My Cybervision64 from 94 do 17" resolutions in highcolor.

Having heard the debate a million times myself, I think, in most instances, that it's the fairest solution... Given the proliferation of "Dead System" software that's floating around. Preservation is a legitimate concern... However... Making sure that everyone on the planet has access to a copy is another thing :)

Reality is, that if you look hard enough, you'll find it no matter how hard they try to pull it down. Hell, before the net got so popular and accessable, copying/pirating was as rampant... and MUCH harder to shut down. I've known people with several Thousand pirated disks in the "Old days" It's just faster and, in today's terms smaller... in the case of the Commodore 64 for example, over 90% of the "classic" game software can fit on a single CD. Which you can get you hands on fairly easily... and there are site if you have the diskspace that you can do it yourself.

If the authors of old software are willing to sell legit copies of their software that's cool, I'd buy.. and do... but it it's just another "Mine! Mine! Mine!" situation, I have very little sympathy for them.

What I personally find objectionalble are those half-assed pirate-wanabees that try to make a buck by selling you it... You can't tell me any of the many "Anthology" CD's for various old systems are anywhere near legit... and now I'm finding people selling disks with pirated games on them as "selling media only" deals on ebay... what a crock!

Bottom line... Shut it down on the net, and up it pops on the BBS's again! Write protection code, Talk SPA and copywrite till your blue in the face, spend millions trying to stop pirating it and watch the pirates laugh in you face. Nobody's ever going to stop guy x from traiding copy y with his buddy z.

Solution: None.

Hi, Derryck, thank you for your reply, but the "cut sheet"
sub-dialog is just the heart of the matter... When I try to open
it, after loading the Straight-Fax drivers in the printer dialog
of Papyrus, nothing happens (the "general"sub-dialog is locked)
and all those strange "help" bubbles start to appear, more or
less in the position they would occupy if the "cut sheet"
sub-dialog could be opened (evidently the bubbles concern
something like top and botton margins etc.). Mystery goes on. I
think there's something wrong in these drivers, 'cause I have
tested them with every kind of setup (autoprograms, accessories,
TOS, MagiC etc.) on my Falcon: the horrible bubbles are still
there...

No, this is not the Question. Since all users jump on the Wintelworld, you
get thery nice second hand conditions.
I had get my A3000D, latest OS and ROMs, 16 MB, SCSI build in, Picollo
SD64 4MB GFXcard, second HD-Floppy, nice Workstation-like Desktopcase with
ZorroIII bus for 500,- DM. This should be about $300.
But this is not the whole truth, without a good 17"/19" Monitor such a
machine is very senseless, so you have to pay extra money for a proper
using.

Bye, Andreas

It's got 96k, hasn't it ? I haven't seen the tables, but I find it hard to
think they won't fit into that. Anyway, such decoding ist precisely the
kind of work DSPs have been invented for. If the Falcon's 68030 does the
decoding in (almost) real-time, then I'd think the 56001 does about three
streams at once in real-time.

> To sum it up, I do think the Falcon is capable of streaming RA.

Considering the DSP, I found it hard to believe that it won't.

Hi, I have a ton of software I would like to sell.
I would like to sell everthing together, or at least in groups of 10 or more titles..
There are games and Utilities..
all originals

Populous box and manuals
Populous II Manual
Sim City Manuals
Wrath of Demon Box and Manuals
Space Ace Box and Manuals
Fire and Brimstone Box and Manuals
the following games have the disks and manuals only
Leisure Suit Larry..lounge lizards
Leisure Suit Larry III
Kings Quest
Kings Quest II
Kings Quest III
Kings Quest IV
Operation Stealth
The Colonel's Bequest
Codename:Iceman
Gold Rush
Frozen Legacy
Universal Military Simulator
Universal Military Simulator II
Battlehawks 1942
Gettysburg
Pirates
Monkey Island
Indiana Jones and the Last Crusade
Balance of Power
Space Quest II
Silent Service II
F15 Strike Eagle II
MegaTraveller
Red Storm Rising
Conquests of Camelot
the following have the box and the manuals....
Microprose Golf
Pool
Addams Family
Alternate Reality: the city
Pirates

President Elect
The Dual: test drive II
Dark Castle
ShadowGate
Deja Vu
Univited
Bubble Bobble - No manuals or box

Utilities and Misc
Timekeeper (harware device) w/box
quickst II 2.21 w/manual
ProCopy w/ manual
ultrascript Fonts w/ manual
Maxifile w/manual
hard drive turbo kit w/ manual
Data Diet w/manual
cornerman w/manual
m-cache w/manual
the Juggler with box and manual
Fast copy pro

LDW Power Spreadsheet/database program Box and manual

also have other misc...
Kings Quest book that covers all the ones that I have..
also other loose disks

make me an offer or just inquire..
thanks

Dear Steve, If you chose a program that requires a Dongle, like Cubase or Logic 2.5, make sure that it will work on your TT. My TT won't recognize the cartridge port if there is a dongle, and I've heard there are problems with other TT's in this respect. Dr. T's KCS seems very complex, but is an amazing piece of software if you can figure it out(I haven't yet, but at least it will work on my TT since it doesn't need a dongle).
Bye now, Mark

Its never been requested, so its not been written. The Nicknames will
generate a "blind" copy, since there is no header generated when
Nicknames are used. This might suffice for you.

>Charles Stanley wrote that he was having no problems with Newsie .90.

There was a problem in 0.90 that would delete the news file (at the users
request), but not remove the line from the overview window. This is
only noticiable in offline reading, and is fixed in 0.92, to the best
of my knowledge.

The HAM modes worked quite well, and with 4096 colours to play with even in
the flicker free low res mode it was quite good. You seem to forget that
the higher resolutions produced flicker mainly because multisync monitors
weren't widely available at that time. In that regard VGA screen
resolutions/colours on what was basically a CGA monitor was a real
achievement.

Stability is a characteristic assigned to the OS, not to a combination
of OS with well-behaving applications. Otherwise Windows and MacOS were
also stable OSes, which they are not.

So, what major MIDI/audio packages were there for the Amiga? What I
found was mainly Paula/MOD-file software. For PC, Mac and Atari you
will find several packages, even for the Atari some are still suppor-
ted.

>> It's graphics hardware is outdated since the late 1980s, according to

>
>Hm, The 1992er line, such as a Amiga4000 can do 1440x568 in 256 or
>Truecolor, it is good enough for video and presentation.

The AGA chipset can not do true colour in any resolution. HAM8 usage -
contrary to true colour modes - generates artifacts wherever sharply

contrasting colours are used. Additionally, the AGA hardware is very limited in terms of refresh rate and max. vertical resolution (1440x568 pixels is a pointless video mode on both AGA and Falcon VIDEL unless you show me a monitor in 2.535:1 format).

And what Miner claimed possible in the late 80s was much better than AGA.

If it has been OK previously I would guess that you may be having
problems with the cabling. Check all the cables/sockets etc., look for
any strains in the cable. The SCSI interface is supposed to deal with
bad blocks so it is unlikely to be medium failure.

If all this fails you may need to back up your data (before it is too
late) and reformat/repartition the device.

Ah. If you look at the motherboard you will find that there is a large
decoupling capacitor on the 5v supply usually very close to the supply
to the RAM. It sounds as though this capacitor is breaking down and
may need replacing.

Hi,

someone emailed me yesterday, that he is selling his Atari gear. The guy has some serious disease and hopes there's someone who likes buying the stuff, instead of it just gathering dust.

Here's what he has got:
- 1 STfm with 2 MB, a SM124 and a 80 Mb hard drive (another 240 Mb SCSI drive is in the package too).
- 1 STfm with 4 Mb and SM124 in "kit-form": separate keyboard and the computer has been partly built into a separate housing, but that one's not finished yet. Working OK, though.

Furthermore lotsa docs/schematics, books on programming and Midi plus "some software" (I gather you'll understand what I mean, wink-wink).

Prices "around 200,- dutch guilders" for each set, negotiable.

If someone wants to know more/start dealing, email him at kuringen@IAEhv.nl

Well, that's cheap, but I'd say an ST alone is worth more than that. The
28.8K modem alone is worth more than that.

> Unit, moniter, printer, 28.8 modem, and a stack of disks. Still looking for

There's no mod to do on a HD to connect it to an ST. You need an
ACSI/SCSI interface and a SCSI drive. Check out the Quick FAQ.

This TT and the big monitor: In North America? East? West? near Boston?

I have a TT setup with what may well be an irrepairable monitor. It might be just as well for me to blow another wad of cash on your setup as to try to fix my blown TTM195. Can't get at the files in my Tt without the blessed monitor!

Any Techies reading this:

Do TTM195's blow their power supplies? ...Or is it always the Flyback? my symptom: TT boots OK: can hear the drive accessing all the files in the usual order. Monitor: no green light on the pilot. Noting at all from the screen . All dark.

Is there one thing in there that usually blows? Does best Electronics have it?

HELP!

Regarding PageStream on a Falcon,

Make sure you install a fresh PageStream setup on the Falcon.

Set Fastload On for PageStream.

Once PageStream is loaded go to the Set Paths option under Global
and set your paths to folders like this...
Documents:Document*.*
Text:Text*.*
Fonts:Fonts*.*

Not like this...
Documents:PageStream\Document*.*

The above really helped with the load time. I have hundereds of
graphics and etc. in my folders.

Also, PageStream grabs all of the Falcons Memory for its own.
Which can cause problems.
One way around this is to use Geneva. With Geneva you can set
how much memory a program like PageStream uses.

I used all of the above and it has solved all the problems I had
with PageStream on a Falcon. It works great.
Hope this helps,
phantomm@kih.net

I hate to say it, but Howard Carson was right. he said that this monitor was failure prone. Unlike Howard, I can't just settle into a new Pentium with a 17-inch display running Windows NT. I just want my TTM195 back.

Symptom: TT boots as usual. I can hear the hard disk accessing all the files in the usual order, as it launches NVDI, &c.

Nothing from the monitor. Black screen, no pilot light. Is this a blown power supply? Is there a fix I can buy from Best Electronics?

Do you really believe that?. The only problem applications were apps
designed to be used on KS1.2/1.3 Amigas, which are so old now that no-one
uses them anymore. The reason those old apps can misbehave is because they
were poorly written, and partly because at the time programmers were not
familiar with a multitasking environment.
Worst case scenario is that such a program would crash, and the error
trapping would allow you to simply suspend that program. This feature works
well, and in reality I have yet to have any program bring the whole system
down.
Those days are long gone...

Personally, I hate MIDI music and have always worked with MODs, even when I had a ST. There are many fine tracker softs available, most notably fasttracker and protracker, Octamed (with MIDI support, recently ported to PC) plus others.

I'm not sure about MIDI audio packages, but MP3 encoder/decoders/players are available. I'm not into MIDI, so I'm not qualified to answer that question.

Good enough for video production houses, where Amigas are still widely used. Easy expansion options render this arguement null and void.

> And what Miner claimed possible in the late 80s was much better than
> AGA.

At the time of introduction AGA was ahead of anything else by a country mile, but I agree.
C= should have used the AAA chipset long before they planned to introduce it. C= really screwed that one... the technology was there, but they refused to implement it.

Clockmeister.

Bob Breeman a ï¿½crit:
>
> how can i transfer files from mac to atari st 520?????

Have a look at the Quick FAQ.

The ST must be equipped with at least a double sided 720K drive (unless the Mac can use 360K single sided DOS compatible disks, but I doubt that) and the Mac must be able to format 720K DOS disks. Format DOS 720K DOS disk on your mac. Stick your files on the disk. Stick your disk in the ST.

Otherwise, use a cable connection with a ZModem terminal emulation program.

If the files are MIDI files, use a sequencer to play them from the Mac and record them in sync on the ST.

Cheers,
Nick

Oops, stupid me...
I forgot, Opcodes studio 4 package supports 128 MIDI channels/sequencer and not to forget Bars & Pipes professional, which has found it's way into many a studio. Both have excellent MIDI features.

>screen . All dark.

For me it sounds like the Flyback is gone. I have had this twice with my
TTM195.
Bradley Koda of Best Electronics give me a useful tip to see if the
Flyback is still working.
If you turn on the powersupply and hold your arm next or near the monitor
you should feel your hair raising up on your arm. If this is the case then
it's probably something else.
>
>Is there one thing in there that usually blows?

Another weak point is the connector that connects the motherboard with the
screen bulb. I had to replace that connector because it was completely
melted.

Does best Electronics have it?

I don't know if he still has these flybacks in stock.
A final note to end this mail: the flyback is rather expencive. I think
it's around 110 USD.

Hello "Clockmeister",

g> Personally, I hate MIDI music
Oh, you don't listen to music at all? Or just classical, jazz or country
stuff?

Don't you have any audio CD? Don't you listen to radio sometimes? Don't
you
look M-TV or something like that?

Nearly all pop and film music is MIDI music.

MIDI or MIDI/audio? I just know Bars & Pipes (and Dr. T's), but I just
know
MIDI versions, not for audio streaming (mixing analog instruments/voices
with
MIDI synthesizers).

If no green light then the PSU is down. It could be anything from a blown fuse to a shorted switcher transistor (which would bring down other components). If you are not expert in TVs, PSUs etc. then you could take it to a TV repair shop - they should know how to mend a PSU whatever piece of equipment it is in.

After 5 years use (or so) it could well be one of the electrolytic capacitors.

As Calamus 1.09n is no more supported and the printer driver format
is, I think, different of the SL ones, I think there's not many chances to
find new drivers...
Except if Calamus 1.09 was sold with a driver generator and someone
makes the drivers...
Good luck

(I think it may be simpliest to get a newer version of Calamus)

I have the following Atari ST package for sale:

Atari 1040STf (1 meg memory)
Atari 1040STfm (1 meg memory -- for parts --> missing powersupply)
Atari SC 1224 Color Monitor
Atari SM 125 Hi-Res Monochrome Monitor
1 Marcus Marconi Trackball
1 ST-compatible mouse
2 joysticks
Supra 2400 baud external modem
Tons (literally 100+ 3.5 disks) of software (some in original boxes):
-games
-MIDI sequencers
-programming languages, utils
-communication utils
All cables etc.

Looking for $150 CAD or best offer.

Equipment is located in Cambridge, Ontario -- prefer not to ship if possible.

I do not know the others, but I cannot think of much that Cubase
does not do. I have used it for years and it seems excellent to me.

Is this only for home use, or are you connected to a school ? There
are some excellent educational prices available, especially at "Music
Village"

There are ways to get 2 midi outs from Ataris. If you have 16 devices
I am sure you would like 32 channels. I have not done it myself so I
do not know the details, but there must be those who do.

I am running mine on a Hades now (with a few graphics driver problems)
but I gather the TT is fine for Cubase.

>offline.

Er..., not quite, Ken: I remarked I *did* have the zero-content problem, but thought it had cleared up. Unfortunately it has not. After offline reading whatever messages there are, deleting them or saving them elsewhere, my practice was - and is again - to delete the XOVER file (quitting Newsie altogether first, otherwise the supposed list of headers will be saved as a false XOVER again). On the next login, I *think* the missing NG messages are received again, but how can one be sure? This doesn't apply to emails: if they were not saved before logging off, they are lost forever.

I have tried, whenever there is an unexplained lengthy pause during (*) downloading, to click FILE/SAVE (or ^S) in the hope that this will prevent losing whatever has already been received: it seems to work, but how can one be sure?

(* This pause always happens at 9xx bytes received, or a multiple).

>And it's screwing around with the subject lines, too. The subject as
>listed in the newsgroup window many times does not match the subject
>line in the message itself. It's so bad that I don't trust it here to

Yes, I had this a few times: but, since choosing the next slower speed for the modem (from 115200 to 57600), it hasn't happened again.

>Time to move to something else I guess.

I guess... :(

Crossed fingers!
Charles.

I'm sorry that you've had this problem, though I think that this is
just unusual for this company.

This is the first complaint I've ever seen about this company, and
I've dealt with them on several occasions and have always received
exemplary service. On the last occasion I spoke to them at 3pm in the
afternoon, made an order with my credit card, and the goods came in
the post the next morning. (I may live in the UK, but Titan are in
quite a different part of the country).

I can only suggest you telephone or email David Encill, and I'm sure
he'll sort out the problem. He's always been most helpful to me.

Cheers!

James

>explain SCSI bus reset ??). And what's about diagnostic tools ?.

Well, I suppose this could be the case. There is a signal on the SCSI bus (pin 4) which causes a reset but, for this to happen, it would need to be shorting to 5v (which is one reason why I thought the cabling may be faulty).

If power levels drop on the ICD i/f this could also cause a reset to be issued. How do you power the ICD? It is usually via a 4 pin connector to the board. Is this secure? Where does it get its power from? The STE PSU or from some other source? You need to check this cabling too. If the power comes from some other source than the STE PSU it may be that this PSU is faulty (often caused by intermittent breakdown of a smoothing capacitor). There is no easy way to check this other than to substitute another PSU and see if you get the samr problems.

I can't think of many useful diagnostic tools for this especially if the fault is intermittent. If you want to check your disc surfaces then you could use HDCHCK13.ZIP (PD) which will run medium checks. But I really think that this is not your problem.

John, I tested all the clients I had at the time and one by one tried them
out with Sting. Got the corruption every time I started Newsie. I thought
it was a Sting problem too at first, but it turned out the corruption only
happened straight after starting Newsie. Checked this literally.

>>So all in all: I can live with that. What Charles Stanley described, every

This kinda time-out is good enough for offline reading. It appeared to be
too short for FTP-ing, but I don't do that any longer with Newsie.
>
>>What it also doesn't do right is handling the article numbers upon

> Is this offline or both online and offline. I don't do much offline
> reading, but I have never heard of this problem from others.

Offline only! Tell you what happens: I fetch news always for offline
reading, the only stuff I do online is binaries. Every once in a while the
"byte-counter" stops (that always appears to be at the end of the article)
and next Newsie goes into its time-out, after that it fetches the next
article. The articles appear to be not missing one thing upon reading
them, so I haven't got a clue what causes it. Only recently I linked this
and the fact that the last fetched article number sometimes is 3 or 4

numbers behind in the Default.grp, together. When I hook up to my ISP in the morning there are many times as much as 50 articles to fetch in CSAS and there maybe as much as 3 to 7 articles where this happens. Reason why I set my time-out from 30 to 5 secs... :-) This happens/happened with all the versions I've been running here. It doesn't happen with Newswatch or Babel (the FireNews fetcher). I seem to recall I've seen messages from others with "problems" like that...

> have the standard connectors fitted (soundblaster like).

It should be mentioned that the "14-bit" sound is achieved by tweaking
the volume registers, which unlike the 8-bit fetch, requires constant CPU
intervention.

The currently available sound cards, while available are not only limited
to big box Amigas (except for one that is due RSN for the A1200), but are
also relatively expensive.

> AGA are comparable to SVGA, but AGA was available on Amigas before SVGA was
> available.

Either you have a strange perception of what SVGA is, or you are very
mistaken. SVGA is typically considered to be anything that exceeds the
maximum standard VGA resolution (640x480) or number of colors (only 16 at
640x480). I can recall seeing 1meg SVGA cards in Computer Shopper as long
ago as 1989, perhaps even late 1988. AGA Amigas were not even announced
until the latter part of 1992.

My experience with the STacy is that the thing is almost bullet-proof. My
father bought one new, used it almost every day for 7 years, the sold it to me.
I have used it in a varity of abusive conditions (corrosive atmosphere, truck
moving along a gravel road, ect.), the only problem was a trace on the keyboard
broke about 1 year ago. It will be a cold day in H*** before I give it up
though.

This is not possible with a ST.Only with a Mega and a special videocard
it's possible and with a TT030 of course.Try to find a SM144 .You can
easily enlarge the screen with knobs and the sharpness is just a little
bit less than a SM124. You can also use a big VGA monitor (B/W).These
are relatively cheap .It's possible to modify this VGA monitor for hooking
on a ST .In Dutch Atarimagazine 'ST' is a scheme of this modification.
Hope you read this !

Jos VLietstra(2X TT030,SVGA 17" Dell monitor,MEGA STE with modified B/W
VGA monitor , 23 X 1040 STF with 23 SM124 Monitors etc, etc.)

Cubase is not a problem in the U.K. (although the price might be). System Solutions keep it in stock, and so do some of the educational suppliers.

Alternatively, maybe a post to one of the Cubase News/Mail groups might yield a second-hand copy, especially as so many studios seem to have changed to other platforms. Just a glance at all their set-up problems brings a smile to many an Atari owner :-)))

These lists are mostly for problem solving but a post requesting direct replies should not upset anyone.

Try: alt.steinberg.cubase for the Newsgroup, or if you want to join the mail list, although there is an automatic way in, I found it easier to send an E-mail to: mats.unden@mailbox.swipnet.se
(He runs the list and could add you - but you will get a whole lots of E-mails !!)

Paul

They might be gone, but not due to improvements in the OS, simply
because there were none. In fact, I find it hard to believe that the
AmigaOS is actually more stable now, with all the hacks and add-ons
necessary to bring it to an almost useable condition...

Well, listening to beautiful .XM music on crappy 22khz/8-bit sound
is not really awesome... And what you understand as "MIDI music" is not
only the internally generated stuff... Think MIDI as tracker for real
synths.

>
>I'm not sure about MIDI audio packages, but MP3 encoder/decoders/players

What sort of dream world are you living in? Living in the past,
maybe. Wake up. After the Amiga's demise as the video production king,
Macs took its realm, and now NTs are eating Mac's lunch. See, Amigas are 2
generations behind in video production.
Expanding an Amiga isn't as easy as you imply. And it's not cheap by
any means.

AAA wouldn't be much. They should've implemented RTG, instead of
AGA, or at least by AAA's time.

Hi,

I haven't been able to see the whole thread, but are we talking real Atari stuff or third-party? I recall a magazine stating that GE-Soft's Eagle, a TT-clone, had a PowerPC card for it coming out... or do I completely miss the point and don't know what your talking about here?

Also, I don't know if any of you know these sites, but perhaps you should check out
www.centek.fr and www.milan-computer.de for some nifty (available as well as planned) Atari clones.

C-Lab, creators of the new Falcon Mk. X's also used to offer some additional hardware back when they were still responsible for Notator and Notator Logic (later on: Emagic Logic). It allowed a lot more than just two MIDI-outs and INs, and also offered syncing hardware (Human Touch?). and SMPTE for video productions.. (or so I recall)

that's not true. YOu don't get a lot at all. Try to find a good FTP
program for free for example? Or even a good terminal, or even
winsocks is not free. They all are either part of wind95/98 package
(which ain't free), or are shareware.

Hi Charles

I have no problems with Newsie on my F030 either. Anyway, how much
better is the Nemesis over a stock Falcon? Where in the USA can I get
one? Is it easy to install, or will I blow up my machine.

Thanxs

Hi Micheal and Nicole,

I believe you can use POPwatch in conjunction with Newsie. As far as saving the URL, enable history logging on Newsie, and use the history file as your default home page.

Tou can use the reply option in Newsie to bring up Everest, or whatever text editor you choose. Newsie will automatically send the E-Mail to the editor. You can then clean it up and print it out

Hope this helps a bit.

B.P.

MP3 is the audio subset of MPEG-2, which is more video-oriented. Both,
of course, are simply compression codecs, but one is tweaked to handle
video data better, the other audio.

Check out http://www.mp3.org for more info.

Is the OVL loaded by CAB ? Check it by clicking the "About CAB" entry in the
CAB menue. The dialog that shows up tells you the OVL info.

Sounds as if your ISP is one of those bloody proxy-only ISPs. So probably
you must use the proxy. Have you told CAB to use port 8080 ? Try using
"proxy.club-internet.fr:8080" (without the quotes of course) ...

Cheers Peter

:It just started happening . I found yesterday the power supply voltage
is
:pulsating so I removed the power supply put in a working power supply
and the
:same thing happens. All chips have been pulled then cleaned and
reseated.

Attach a harddisk, the bombs may disappear. In that case your computer
thinks
it has no diskdrive. You'll need to check your diskdrive, maybe with
another
system. It could also be a buffer circuit, 74LS06, which frequently
gives up
breath on 1040:s. Just snip it off and replace it with a new one (and a
socket).

Alternatively you could check your sound chip, the DMA and the FDC.

Good luck!

MG

The ST had Spectrum512, which displayed 512 colors in low rez. Then
came a slew of formats that did 4096 when the STe came out.
Photochrome put 32,000 on screen colors on a stock STe screen, and
then BSS Apex TGA viewer put 24 bit color pictures on STe screens.

There was also a program called Double2 which gave the STe an Amiga
type flickering display at 640x400 x 4 colors.

What would it take to contact the old software houses and ask them if they could make their software PD, or shareware. What about the companies that are no longer in business. Could Sierra release the source code for their old ST games and allow some hacker to make it take advantage of the F030, or TT030 extra features. Could the 256 color graphics be converted. The VGA versions of Sierra's old games are quite nice. That's just an example. What about the rest.

ID Software released Doom into the PD. It's called giving back. If it wasn't for the C=64, atari, and amiga many of the software houses would never have gotten off the ground floor.

Maybe we could get a list together asking for old ST games to be put into the PD.

6619. Internet Software I'd Like to See

Newsgroup: comp.sys.atari.st
Date: 1998-09-24 00:00:00 UTC
From: nameerf@flash.net
Message-ID: <6ucb3i$2fp$1@excalibur.flash.net>
Source record: 93261

Here are some internet programs that I'd like to see made (if they are already done, let me know):

1. An ONLINE News reader/viewer/poster besides Newsie or an update to Newsie that can let the user define what programs to use for E-mail, FTP, and Web Browser. For instance, I like Newsie's News handling, but I'd like to use a different program like My Mail for E-mail, and would like any URL links in the Newsgroups to be sent to CAB instead of having to either deal with the incomplete browser in Newsie or write it down and switch programs. Perhaps allow any one of these to be opened automatically (if I want it to check e-mail immediately, for example). This would make an awesome shell program for Internet use. I really hate having to switch back and forth between programs for everything I want to do.

2. An E-mail program that lets you print your e-mails. For one of my classes at the University here, my teacher sends us class outlines for the next lecture, which I have to print out and bring to class. It's a bit of a chore to once again run my E-mail program, save the E-mail to a file (which My Mail doesn't do - or does it and I just can't figure it out?), then switch to a text editor, print, then go back to whatever. This program should also be one that checks E-mail automatically every x seconds.

3. An MP3 player and a Real Audio Player (streaming or not doesn't matter to me) for the Falcon

4. An ICQ chat program for Sting.

Then I'd be very happy! :) Thanks!

MK> Does OS-9 _realy_ exist for the Atari?? Any more info on this? Ido
MK> know that
MK> OS-9 are available for the 68k range of CPUs though but that is
MK> hardly the same.
Well I have a boxed OS9 developers system for the ST down the shed.

Though it will only run on an STFM with a 68000@8Mhz (any faster or other
anomolies and it bombs out on booting!)

My old STFM looks great running OS9 from its harddisk next to my
Dragon 64 also running OS9 from 4 floppy drives! ;-)

Indeed, though you could possibly argue the same about Geneva and Magic ;-)

OS> EUMEL/ELAN (a text oriented multitasking, multiuser OS,
New one on me!

OS> RTOS/UH (RealTime Operating System/University Hannover, Germany -
Hmmm, I think I've heard of this, though I may be thinking of
something PC related.

OS> MINIX (royalty free UNIX version from Tanenbaum, Michigan(?)
Did I forget this one? :-)

OS> Ksomething (KDE?) (an experimental, graphical multitasking OS
OS> published by
OS> the leading German computing journal c`t)
You guys get all of the good stuff! ;-)

OS> CP/M68k (the father of GEMDOS, but I don't think, that it has been
OS> sold)
Isn't there a web site with it for download?

OS> At least, there is EIFEL, an OOPL. I really don't know, whether
OS> this programming language runs on TOS or brings its own OS with
OS> it.
Well in that case is there a version of Smalltalk or TOPS (I think it's
called TOPS?), which both provided their own operating environment.

OS> ZX81
OS> CP/M (and the Z80 of course)
Did I forget the ZX81 and CP/M as well?? Two of the few emulators i've
actually used as well!!

OS> Something forgotten? :-)
What?

OS> least, the first "Macintosh laptop" was the ST-Book (which was
OS> even used as a
OS> Mac laptop by a German insurance company using the Mac emulator
OS> Spectre).
OS> As
OS> time goes by ... :)
Interesting. I recall being given some floppies which when you booted the ST

off them gave you an Apple Mac (running something like System 6.0.5), not that I ever ran anything more on it than some applets which came with it. I might even have the floppies lying around somewhere.

Sounds similar to "The Juggler", a GEM task switcher available in the late
1980s. (Reviewed in ST User in mid-1988 IIRC)

Ah yes - I remember David Encil mentioning that adaptor when I was quizzing
him about the card. Worked very well with a Samsung A4 monitor, however the
screen curvature was a little offputting.

>(Mine has stopped working - I suspect that the connector has worked loose.)

Those sort of adaptors are a bit of a weak spot - guess you'll have to prise
it out and put it back in again - watch those pins :-!

> What do you think??? Cubase Score, Emagic Notator or Dr.T's KCS Omega.

Difficult question. It's much more a matter of feeling than strictly
which one is better. At least Cubase and Notator are compatible with
there PC/Mac counterparts. Dr T's is said to be very powerful, but I've
never seen it on this side of the Atlantic.

The question really runs down as to which one is available to you.
Nowadays, it's pretty difficult to get a copy of any of these programs.
So, if you find one, try it out and see if it fits your needs. They all
probably will.

> I plan on using the program on a TT030. My setup consists of about 16
> different MIDI devices.

You should have a look at the following address to find a 2nd MIDI out
adaptor, allowing 32 tracks. It's compatible with Cubase and Notator.

I'm about to build a small studio and I'm thinking of picking up an
Atari computer to run Cubase on.

The only models I'm interested in are either a STacy or a Mega STE. And
maybe a Falcon. I know some Atari's had problems, so I have a
simple question:

Is there anything about the Stacy or Mega STE (not ST) that I should think
about when buying one.

Futhermore I'm a bit interested in hardisk recording with Cubase audio and
a Falcon. Apart from an Standard 4mb RAM Falcon, is there anything else I need
to do this satisfactionally. (Presumably a large SCSI HD of.c. :)).

> about when buying one.

I don't know much about the STacy, as these are pretty rare beasts. I
think they are much harder to upgrade than an STE or Mega STE. They are
also rather fragile (especially the screen and keyboard). Only get a
STacy if you will be carrying your stuff around, otherwise, get an STE
or Mega STE.

> Futhermore I'm a bit interested in hardisk recording with Cubase audio and
> a Falcon. Apart from an Standard 4mb RAM Falcon, is there anything else I need
> to do this satisfactionally. (Presumably a large SCSI HD of.c. :)).

Yes, a Falcon is mandatory for recording audio. You need a large SCSI
drive of course, and need to have some modifications performed on the
Falcon: the clock patch, and line level ones (the Falcon has a mic level
input, and a bass boosted headphone output). You can do without the line
level modifications if you decide to use an DSP interface that will
allow several separate in/out channels direct to the DSP.

Cheers,
Nick

Ha ha, I have tested Bars & Pipes and it was the worst shit I have ever
tested. Looks like a game as all Amiga programs.
What happend to the Cubase which was under development for amiga?

>at your setup. Dimes to donuts, it ain't like mine...

Howdy Charles,

OK, here come my experiences with the versions 0.80, 0.82, 0.86, 0.88 and 0.90 for the last 6 months.

Some of you might recall me having those problems with corrupted Route.tab and cache.dns files at the start (using 0.80/0.82/0.84). Solved by leaving out cache.dns, whereafter a new one was generated and the problem was over. I recall at least 4-5 other people been having similar problems with corrupted files.

Only problem turning up every now and then was articles missing in the offline folders. I *know* I never deleted them, but Newsie must have deleted them anyhow. They were still mentioned in the overview, but "pressing the article line" to bring it to a window gave me an empty one. Checked the offline folder and they were just gone. Not happening everyday, but on occasions.

I can't recall having lost e-mail.

The only other problem I had with an earlier version was using UUE attachments: only able to do one per program start. It's OK with 0.90 but I switched to MIME in the meantime.

So all in all: I can live with that. What Charles Stanley described, every now and then on somany bytes or a multiple is happening here too occasionally, but the articles DO show up. I set the time-out to something

like 5-6 secs to prevent long waiting times between those articles. Works good enough for me.

What it also doesn't do right is handling the article numbers upon transfer completion. Everytime I have to edit the Default.grp to prevent it from fetching articles for the second time. I gather it has something to do with the time-outs for this above mentioned problem.

What I don't like however, is the ability of Newsie working behind the back of Gemdos... thus it IS possible it starts screwing around with files on literally any partition, and it just could as well be the FAT's. To my knowledge it hasn't happened and I do hope it never happens, but don't blame me when it happens to YOU. Go ask Peter if you'd like.

I'm running Okami now for about a week (plus FireNews for evaluation since a day or 4) and I haven't seen trouble with these at all. Okami will be the major replacement, but ever since I started with those programs I had to say "Newsie was fine, easy handling, lotsa features, if only I could get a guarantee my files won't get screwed...!"

Newsie's still on my disk, I use it only for ONLINE work now and that's another thing it does very well.

I won't get hysterical about Newsie, I appreciate several options highly if only its ability to screw files would be suppressed...

And the suggestions made by this other guy (forgot his name): would be nice ones!

Hello, I have decided to sell one of my Falc's.
It's an Atari Falcon Motherboard with all audio
and clock-patches. It has also FX-card with 10Mb
Fast-RAM and 4Mb ST-RAM mounted by dealer.

With FX-card you can run your falcon in 16,18,20,
32,36 or 40 Mhz. This one is stable in 40MHz and
you can run CAF in 806x744 in 16 colors.

MyMAIL can check email every x second.

MyMAIL can print and save mail.
To print or save do select a mail in the inbox with right mousebutton
that shows a popup menu
from this popupmanu you can select Print, save ....

The current version hav a bug in the save function if
you are using ram disk.
This is fixed in next version.

6636. Re: CAB problems under TOS with STING 1.15

Newsgroup: comp.sys.atari.st
Date: 1998-09-24 00:00:00 UTC
From: rcain@zetnet.co.uk
Message-ID: <6ud40v$51k$1@roch.zetnet.co.uk>
Source record: 93278

On 23 Sep 1998 19:50:04 , club microcit wrote:

>i can't use CAB 2.7 DEMO with STING 1.15

Peculiar!

>if proxy empty : "waiting for data time out #117" appears on screen,

Yes, this is quite normal. The time out will tick down to 0 while
waiting for data from the ISP.

>if proxy filed with proxy.club-internet. fr : "connecting to host"
>appears and anything else
>what is the problem ?

This means it is failing to connect to the host!

>my provider proxy is proxy.club-internet.fr and is port is 8080

This needs to be set up in Sting's DEFAULT.CFG as well as in the CAB
Options. In my DEFAULT.CFG I have:

HTTP_PROXY = www-cache.zetnet.co.uk
HTTP_PROXY_PORT = 3128

Have you got similar? You could even try the above zetnet cache as an
experiment.

Anyway, forget proxies at the moment your BIG problem is just getting
a normal data connection.

Is your CAB.OVL in the CAB/MODULES folder? I use 1.3011B and it's just
fine.

You could try deleting STING/CACHE.DNS and re-booting. This cache
sometimes gets corrupted and produces symptoms like yours. STiNG will
make a new one.

First of all, thanks for the reply. I have already double checked the cabling, seems to be ok. Somebody told me it could be a power problem (would explain SCSI bus reset ??). And what's about diagnostic tools ?.

david.guillen@skwbio.com

Hello Spencer,

S>>> Add to this SMS2 and Mirage, plus there was another multitasking
OS>> MultiGEM (AFAIR no OS, just an enhancement)
S> Indeed, though you could possibly argue the same about Geneva and Magic
;-)
Hmm, Geneva is AFAIK not an enhancement, but a replacement of parts of the

original Atari OS. MagiC is a new OS from scratch, just compatible with
the
original OS, but it enhances or replaces nothing, it's just a complete OS
:-)

OS>> EUMEL/ELAN (a text oriented multitasking, multiuser OS,
S> New one on me!
Used a long time ago at some German universities and was one of the first
Non-
Atari OS's ported to the ST.

OS>> RTOS/UH (RealTime Operating System/University Hannover, Germany -
S> Hmmm, I think I've heard of this, though I may be thinking of
S> something PC related.
It's not an Atari-only OS. But because of the ST price and the speed and
the
68000 and ... I suppose nearly every German engineer learned on Atari ST
the
last decade.

In Germany, the ST was *very* popular in universities *and* companies for

engineering purposes (sometimes it is still in work). The companies used
the
ST reads like the Who is Who of the German industry. :-)

OS>> MINIX (royalty free UNIX version from Tanenbaum, Michigan(?)
S> Did I forget this one? :-)
Obviously ;-)

OS>> Ksomething (KDE?) (an experimental, graphical multitasking OS
OS>> published by
OS>> the leading German computing journal c`t)
S> You guys get all of the good stuff! ;-)
Germany was a sort of "Atari heaven" ;-)

OS>> CP/M68k (the father of GEMDOS, but I don't think, that it has been
OS>> sold)
S> Isn't there a web site with it for download?

If so, it would be nice to post the URL :-)

S> Well in that case is there a version of Smalltalk or TOPS (I think it's
S> called TOPS?), which both provided their own operating environment.
Yes, Smalltalk is/was available. But never heared of TOPS.

S> Did I forget the ZX81 and CP/M as well?? Two of the few emulators i've
S> actually used as well!!
:-)

OS>> Something forgotten? :-)
S> What?
Don't know :-)

S> Interesting. I recall being given some floppies which when you booted
the
S> ST off them gave you an Apple Mac (running something like System
6.0.5),
S> not that I ever ran anything more on it than some applets which came
with
S> it. I might even have the floppies lying around
S> somewhere.
There were software hacks for all Mac emulators (original only hardware,
just
because of the place for original Apple ROMs), but there was also a
Spectre
GCR, which made an Atari to read and write the (old) double-density Apple
GCR
disks.

What you need is STRINGserver, Not out yet, but should be released
this weekend for the first time. 100% written in ASM. Comes with a
text viewer also, Which you can assign to read all your messages. This
textviewer can send messages to the stringserver, which then forrward
whatever the textline you clicked on to the appropriate application,
Very hard to explain like that, but that's exactly what you want/need,
Except in more powerful/flexible than just email/news. :)

>2. An E-mail program that lets you print your e-mails. For one of my
>classes at the University here, my teacher sends us class outlines for
>the next lecture, which I have to print out and bring to class. It's a
POPGEM View as HTM, will format all nicely the email message as a html
document then will send the output to CAB. From there, PRINT. (all
with nvdi etc, VERY VERY nice). Or you can drag and drop the PIN icon
onto your favorite text editor if you need to edit the email for
example.

>bit of a chore to once again run my E-mail program, save the E-mail to
>a file (which My Mail doesn't do - or does it and I just can't figure
>it out?),
POPGEM imo, has the best functionality as far as FETCHING email. YOu
can do anything you want.

then switch to a text editor, print, then go back to
>whatever. This program should also be one that checks E-mail
>automatically every x seconds.
POPGEM again, (registered option only though for automatic checking).

>4. An ICQ chat program for Sting.
I heard someone was working on that. icq is possible on atari, as I
use micq on MiNTnet. POrting it to stik/sting is a matter of days
only.

NEWSie will allow http URLs to be sent to CAB (if it is currently
running) by holding down the shift key when clicking the URL.
Since there is no pathname to define a "prefered" browser, CAB must be
running to do this. (You must have a multitasking OS to do this.)

What do you like about MyMail that NEWSie doesn't have?

>2. An E-mail program that lets you print your e-mails. For one of my

NEWSie can print email via the File 'Print Article'. Yes, it says
article, but it prints mail too. NEWSie also allows you to save mail
as something else via 'Save As' either in the Mail Toolbar, or the
File main menu.

Well, first you'd have to compile a list of software and their listed copywrite holders, then you have to find them, or whoever owns them now, Contact them and ask if they'd be willing to allow their software to be released as PD, Shareware, Freeware, Donationware, Etc. and then see if you get a response. Other option is to get an "Open Letter" to old software authors/copywrite holders on some prominent (Atari, Commodore, Tandy, Etc.) "tribute" site, and hope overtime they see it and respond. There have been some attempts that I've heard of, and number of authors/copywrite holders have release their old software as PD/Shareware...

It a fairly good bet that a LOT of the original source code, especially for the older stuff, is gone, or at very least good and lost. I called a number software companies a few years ago to see about a couple old software packages... because of turnover, buyouts, and time several didn't ever know/remember that the owned it, another few would have sold me a copy but couldn't find it, and one guy asked that if I ever found a copy to mail him one!

Generally with old "dead system" software, what you hear is when an author/copywrite holder complains when he find their stuff all over the net. (gee, I wonder if Bill Gates still get pissed when somebody copies a punch tape of Altair Basic :) Generally it appears that very few Authors/copywrite holders of old "dead system" either care about or are willing to spend the time and money to stop the pirating... I know several very easy to locate, publicly accessible, Commodore FTP sites for example that contain well over 600 Meg of Games, They've been around for YEARS! and it's not like their hiding!

> ID Software released Doom into the PD. It's called giving back. If
> it wasn't for the C=64, atari, and amiga many of the software houses
> would never have gotten off the ground floor.

I salute ID Software. It's great when a company does stuff like that! A piece of software has a good long successful run, then in appreciation it gets freed to the public. Unfortunately, most companies are only

concerned with what they can take from you wallet... Giving back usually takes a court order and several appeals :)

> Maybe we could get a list together asking for old ST games to be put
> into the PD.

It's a doable proposition... It would take a lot of time, a web site, and someone who's willing to stick with it, (and knows how to P.R. it just right :)

AFAIK there are no *players*, but a couple of decoders has been
ported. They're pretty slow though... I remember testing one of these
a few months ago, but I can't remember what it's called and where I
found it.

Hello,

I'm research an internal SCSI CDR CD ROM. For type look here :

Ricoh RS 9200CD
Philips CDD521, 522, 2000
Kodak PCD 225
Plasmon RF 4100, CDR 4220
Yamaha CDR 100, CDR 102
HP 4020
ou Grunding CDR100 IPW

Thanks for your answer and your price on my E-Mail.

Best regard.

6654. GNU Chess version

Hi,

I got GNU Chess 4.00pl.62 GEM version 0.9
This is a port by warwick@cs.uq.oz.au

I want to know if this was the latest version. Unfortunately warwicks
email adress doesnt work anymore.

Bye, MC.

Hundreds of questions. One answer: The Atari ST Quick FAQ.

IDE is hardly possible, but SCSI is with a SCSI host adaptor such as the
ICD Link, the Link'97 or the Top Link.

Cheers,
Nick

I was going to say the The Upgrade Shop did IDE controllers, but now I
think about it, isn't that STe only?

6659. STE RAM

Newsgroup: comp.sys.atari.st
Date: 1998-09-25 00:00:00 UTC

Having lost my STE manuals a long while ago, I have a question regarding the SIMM RAM: What types do STEs take? Are they readily available in the UK anywhere?

6660. Re: connecting hdd to st

Source record: 93152

You need a host adapter. You can use the LINK by ICD and a revovable drive like the JAZZ or EZ230 by syquest. The LINK allows you to connect any SCSI device to the ST thru the HDrive port. You can also build your own drive system. I believe the drive have to be SCSI so those $99 JTS drives won't work.

It's amazing for years Atari made computers without hard drives, then they buy a hard drive company.

B.P.

It's in the Quick FAQ!

Standard 30pin 1Mb SIMMs. Any speed <120ns (ie: ANY speed), and parity
doesn't matter.

You can find them in any second hand computer shop.

Cheers,
Nick

I think there is a mis-conception about online and offline newsreading
here. Offline simply gets everything available. Online allows the
selectivity you may want. I think you are asking for some hybrid
which provides both, but takes twice as much time (IMHO).

Well, I have a TT, 10+16 M, using magic. And it sure screws my system and
HD up! The latest episode, wiped out the contents of my Inbox.mbx. I was
able to re-find the lost mails with mailbox.prg, and had to manually move
them back to inbox. At the same time, I got 3 lost clusters, and it made
one of the letters 68Mb long! I recently moved newsie to a partition all
by itself, and every 10 uses of newsie or so, I get lost clusters on that
partiton. No other partition gets errors.

Single TOS on a Hades? You must be joking.
Get N.AES 1.1.7 (the English resource can be found on Jo Even Skarstein's website) and Thing 1.27 or Jinnee.
This combination really rocks on a Hades. All the major programs works with N.AES.
Alternatively you can use Geneva/Neodesk (or Thing). This combo works also on the Hades.

Hi Boris,

well, another one. The last somany months I've seen messages about this
stuff, with sometimes the logfile being mentioned... I was just thinking,
could one sort that out? Turn off the log option and C what happens then.
Or are there users who can SWEAR it happened with the logging turned off?
Just got a faint idea it has to do with the logging....

|Or are there users who can SWEAR it happened with the logging turned off?
|Just got a faint idea it has to do with the logging....
| . . . .

I used to get regular problems with lost clusters when the log
options were turned on. Using EDGE to correct the errors and save
the lost clusters, generally showed items from the log, often mixed
in with bits of the postings.

I turned off all three log options and have had many fewer problems
but _not_ none.

Hmm, ordinarily, I'd say that this is a termination problem, but they often
don't occur with only two drives. The Syquest probably terminates with the
passive terminator that came with it, but what about the Maxtor? It is
terminated?

Hey! Someone recently noted that Pagestream sped up on a Falcon if you turned on Fastload bits for all the drivers and misc. programs that come with it. I was facing load times of over 90 seconds for Pagestream. Turning Fastload on (and turning TT-RAM off on a couple of programs -- don't know how THAT happened -- no TT-RAM) has switched my load time to --- 3 seconds! Thanks guys!

6685. Help wanted

Newsgroup: comp.sys.atari.st
Date: 1998-09-25 00:00:00 UTC
From: ekaljumagi@clhs.lake.k12.ca.us
Message-ID: <6uh9lv$25h$1@nnrp1.dejanews.com>
Source record: 93177

Just thought I'd try my hand at my list of perennial problems. All advice graciously accepted:

#1 -- EZ-Grade prints fine from my STe whether in TOS 1.62 or Geneva regardless of whether or not NVDI or SpeedoGDOS is running. On the same printer I get nothing from my stock Falcon 14Mb, regardless of what other software is running (if any). The program itself runs fine on the Falcon, but selecting any print option merely has the effect of having the mouse arrow disappear for a few seconds. The printer doesn't make a peep. Every other program I have prints identically to the STe and the Falcon -- what gives?

#2 -- Infopedia 2.0 does not accept mouse input when in Geneva, including using the ALT-SPACEBAR window drop command. The cursor keys work though, allowing one to read articles. Any ideas?

#3 -- My main printer right now is a Deskjet 500, which does a passable job from everything from Imagecopy (a bit of banding) to Atariworks (very nice!) to ASCII dumps. What are the upgrade options that would keep the ASCII dump option, and provide for CMYK while running under NVDI? If I were staying monochrome, the Brother family of laser printers would be the no brainer option (cheap, reliable, and auto emulates both the 600 dpi HP laser and the Epson FX), but I'm a bit lost on even what HP, Canon, and/or Epson color deskjets even work well on the Atari.

Ah ha! The Pagestream slowdown occurred when I went from Warp 9 to NVDI
(didn't use PS for a couple of months during that time so I didn't make the
connection). As seen in my other post, switching all files to Fastload
completely solved that problem.

I had a similar problem connecting two Hard drives to an STe. Turned
out in the end that they both had the same ID number. This is usually
changed physically on the drive, maybe a switch on the case or maybe
some dip-switches inside.

My Syquest 230 can be changed by a switching sequence using the eject button.
Having said that, it came with the default ID set to 4 which I suppose
is unlikely for your Maxtor.

What HD driver software do you have ? It should have a way of scanning
for the drives and telling you what ID's they are set to. With my
earlier software I has to "relog hard drives" before it would
recognise the extra device.

Paul

I can *swear* that it happens, but with much less frequency, with the logs turned off and always quitting NEWSie before disconnecting. In my case, religiously using HDSENTRY or CLEANUP after every OFFLINE session, the corruption was always badly linked clusters. The offending clusters *always* included the NEWSie log header.

I was lucky, I never had a data loss but that was way too much work. :(

> necessary to bring it to an almost useable condition...

This is your problem, most Amigausers have a very stable system.

> >No. The 14bit feature has always been there, and is very flexible.

> Flexible in what way? Can you digitize sound in 14 bit too?

Do you ever seen an Amiga? No Amiga can digitize a simple sound. You need
extra money for that. If you buy a 8 Bit digitzer, you can digitize in 8
Bit and if you buy a 16 Bit Digitzer you can digitize in ....
Only Amigasoundcards have Digitizers buildin.

> Do you get CD-quality sound in/out?

CD quality ist 16 Bit/44100, Paula let you get 14 Bit/max. 56000 so the
sound reaches not CD Quality, but: The 14 Bits are a lot better than 8 Bit
and with consumerequipment like PC-Soundsystems you will never hear a
difference. With MP3 you get also not CD-Quality but people listen this,
so what?

> There were no serious MIDI apps for the Amiga. Don't know right now,
> but it's probably not better.

What do have against camoflage for example? But you are right, i would
never buy an amiga for Midi, Ataris or MACs are a better solution for
that.

> Hehehe... That's funny... _ALL_ AGA Amigas had artifacts in HAM8,

Yes but belive me, the Artifacts are smaller than good quality JPEGs. If i
would show you 2 Pictures, one in HAM8 and the other on a GFX-card in
Truecolor you never can say that that is. And if i show you some pictures
(from a photocd for example) in HAM8 or in an 64k-modes you will see, that
HAM8 looks a lot better.

> same as all ECS Amigas had artifacts when using the HAM mode.

No. HAM on ECS was only 320x512 in a Colorspace of 4096 colors with max.
16 colors per gun. You get never fine colordifferences with this.
I found HAM on ECS as an unusable mode. For the eyes even looks the old
dynamic ham highres modes (640x512 with changing palettes) better than
these lowresmodes.

On HAM8 you have a colorspace of 8/8/8, this is more than the highcolormode (5/6/5) on a GFX-card, so that HAM8 looks on Pictures better than a highcolormode on a PC.

> Don't try to spread bullshit here.

I have the feeling, you like not to discutate, you like to start a flamewar. I know, that this group is a bad place to tell somthing goods about an amiga and i see all the old false arguments again and again.

> HAM8 is a hack.

Yes, but a nice hack. It is possible to play Animations with 640x480 in 25 fps or with special Software like "clarissa" in 50 fps (this means, you can alter every halvepicture of PAL)
Even raytraced sequences looks very good on this modes since you get fine colordifferences wich is important for raytracing.
Today with the newest PC's its also not so simple to get SVGA without smoothing.
On the other side, HAM8 is not useful for the GUI, but the people uses for this a GFX-card. I would not look at 50/60/70 Hz screenrefresh for serious work.

> What sort of dream world are you living in? Living in the past,
> maybe. Wake up. After the Amiga's demise as the video production king,
> Macs took its realm, and now NTs are eating Mac's lunch. See, Amigas are 2
> generations behind in video production.

Yes but this have other reasons. Serious firms uses never machines without support, wich is dead since 1994.
The second reason is, the flyer/videotoaster was only in NTSC, so that europe cant use it.

> Expanding an Amiga isn't as easy as you imply.

Hu? Open Case, plug in card, close case, insert driverdisk, click on installer, ready.

> And it's not cheap by any means.

Yes, but this counts on all Winteloutsidecomputers. Why you have to pay for a MAC-Millenium more than for a PC-Matrox? Are atariequipment cheaper than PC-equipment? What costs a gfxboard or a 64 MB RAMcard for an Atari 1024? I asume a lot more than a PC gfxcard.

> AAA wouldn't be much. They should've implemented RTG, instead of
> AGA, or at least by AAA's time.

Yes, this would be nice. So you have an inofficial standard for RTG and an inofficial standard for RTS (retargable sound) to use.

> of OS with well-behaving applications. Otherwise Windows and MacOS were
> also stable OSes, which they are not.

i understand you, since i came from the *nix fraction. But the most users
doesn't like reasons, they see, that there machines run stable and that
count. A few applications like patches for the OS are wellknown to crash
your machine, if you don't use it, you never get crashes. My machine
/*
one of my machines, i own an acorn, a PPCmac and even Wintel, i would buy
if i get cheap a Sinclair QL and an Falcon
*/
renders animations a week long without stopping, if i had time, i "stress"
the editorthread (yes, such applications are multithreading, the
rendertask doesnt stop your other work) with new projects.

I can only state, that the latest AmigaOS are very stable.
I know, an Atarinewsgroup is the wrong place for that. Try to say, that
you can make some usefull with an PC in an amigagroup, you have after this
to alter your emailadress.

> And cheap PC 16 bit boards can do hidden 27 bits, then?

Does this had a hidden smiley? there are a real 14 Bit mode. You can even
calibrate your D/A in this mode to get best results. And this results
sounds a lot better than 8 Bit. It makes sense, to play MP3 with this
modes.

> So, what major MIDI/audio packages were there for the Amiga? What I
> found was mainly Paula/MOD-file software. For PC, Mac and Atari you
> will find several packages, even for the Atari some are still suppor-
> ted.

Yes, for the Amiga are only packages like camoflage. For Musicans are
Ataris a better choice, but this mean not that, if you already own an
amiga you can never make MIDI.

> >Hm, The 1992er line, such as a Amiga4000 can do 1440x568 in 256 or
> >Truecolor, it is good enough for video and presentation.

> The AGA chipset can not do true colour in any resolution. HAM8 usage -
> contrary to true colour modes - generates artifacts wherever sharply
> contrasting colours are used.

That have artifacts to do with the colorspace? Do you mean, that JPEGs are not in truecolor?
HAM8 have for each color 8bits per gun, this is more than a highcolormode, and you see it, if you display pictures from a Photocd in HAM8 or in highcolor on a GFXboard.
On pictures HAM8 looks better than highcolor and in 800x600 or 1024x768 you will never see these artifacts.
For a GUI these modes are not usable. (For a GUI no-one build in mode is usable :))

> Additionally, the AGA hardware is very
> limited in terms of refresh rate

Yes, i wrote this, why do you cut this out of quoting? This is the reason, why every serious Amigauser have a GFX-card in the case.

> and max. vertical resolution (1440x568
> pixels is a pointless video mode on both AGA and Falcon VIDEL unless
> you show me a monitor in 2.535:1 format).

You are right, nice, that you can tweak the 1440x568 to 1024x768, but this is only useful for showing pictures.
In the real world the buildin chipset are only used for games and animations, the rest will do a gfxboard better.

Tell me about it. MagiC also allows you to set how much memory a given application is allowed to use, but I've tried it with PageStream on my Falcon, and the program just ignores it and grabs it all anyway...

Well, you _could_ use My Mail for mail and just ignore that portion of NEWSie.
:^)
And, if you click on a link (in an e-mail or newsgroup article) in NEWSie
while holding down <SHIFT>, it will load it into CAB and take you to that page
if you're online at the time. Holding down <CONTROL> copies the URL to the
clipboard.

You can print e-mails from within NEWSie.

>3. An MP3 player and a Real Audio Player (streaming or not doesn't matter

I second (and third) that one!

Also, do you use a multitasking system like MagiC? If you do, switching
between programs is no longer a time consuming task like it is with (single)
TOS.

6701. PageStream Loading

Newsgroup: comp.sys.atari.st
Date: 1998-09-25 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6uemg2$fjh@enews4.newsguy.com>
Source record: 93227

After hearing the discussions of loading times of PageStream...

I've always had the fast load bit "ON" for PageStream (and my other applications and AUTO/ACC stuff), but I never thought to set it to "ON" with the actual font files of PageStream. I don't know, I guess I thought it only affected executable (.PRG / .APP / .TOS) files. I was wrong.

My load time with PageStream 2.2SE (with approximately 150 fonts in 2 different directories) took around 1:25 to load when the program itself had the fast load bit set to "ON".

After setting fastload "ON" with all my fonts & modules, the program now loads in about :05!

Think of all the time I could've saved over the years...

Actually, Maxifile III was a commercial product from CodeHead Software (no longer in business). Basically, it's a disk/file copying/manipulating utility. It's similar to Kobold but it came out much sooner. I used it all the time on my old STE, and kept on using it with the Falcon (even though it has a slight redraw problem in 256+ color resolutions, and can crash with partitions larger than 550meg). Otherwise, it's very useful. Anything you need to do with files can be done with Maxifile III.

At what cost?

AGA Amigas were not even announced
> until the latter part of 1992.
>

In hindsight, it's probably not fair to compare VGA/SVGA/ECS/AGA because
it's really a case of apples and oranges isn't it?

If you take into account HAM modes, workbench modes etc vs VGA/SVGA modes there are advantages and disadvantages to both. I can run 800x600 16 colours on my ECS Amiga, so by your definition it is a SVGA mode. But 800x600 on ECS isn't practical.

One thing that can't be denied is that the Amiga brought these capabilities to everyday users, for relatively little cost.

Out of curiosity, how do they compare?
Falcons are rare here, in fact I've never actually seen one.
Sounds like a nice piece of hardware (from what I've read), but the OS is a letdown.
True?

Regards,

Clockmeister.

Date: 1998-09-25 00:00:00 UTC
From: Jeff Brown <gloobert@diac.com>
Message-ID: <6ufd0d$2oi@nnrp1.farm.idt.net>
Source record: 93232

I am trying to backup the data on my Maxtor 7120 Scsi Drive, to a Syquest EZ135.
I have a MegaST4 with an ICD Link2 adapter connected to the Maxtor drive and then to the Syquest.
When I boot up, only the Syquest is accessible. If I disconnect the Syquest then the Maxtor is available.
Is there any info available on getting these two drives running simultaneously?

I've searched the FAQ sites and have no manuals or documentation on this Atari stuff.
I am an Atari newbie here and any suggestions would be greatly appreciated!
Thanks in advance.

Many if not all of the Calamus SL drivers work with Calamus1.09N, you rename
them with a CPD extention and away you go.

Suggest downloading the demo version and giving it a go! :-))

Have you copied the file STFAX.MOD into your papyrus MODULE folder and set
the output folder to external driver with STFAX.MOD cited as that driver?

If you've already done this then the only suggestion I have is to use the
STFax GDOS driver instead.

Otherwise I'm stuck!

>"pressing the article line" to bring it to a window gave me an empty one.
>Checked the offline folder and they were just gone. Not happening
>everyday, but on occasions

What I think is happening is sometimes files are not closed properly
causing missing clusters or multiple files linked to the same area
when other files are saved to disk.
This seems to only happen if for some reason you have to terminate the
file transfer because of a bad connection, or Newsie or another
application terminates or locks up the machine before the file is
completely saved to disk. If you don't check the disk with something
like Correct, you won't notice it at first, and you will have either a
file that cannot be deleted with GEMDOS, has illegal characters for a
file name, or just seems to be deleted because of improper directory
structure. The next time you notice a missing file, run Correct or
Edge and you'll probably see this. I don't think it is directly
Newsies fault. I think that saving data on the fly to the hard disk is
risky on any setup, and your bound to run into these problems when you
break a window (excuse the expression). I guess it's the price you
have to pay to have an application that will run in 512K or ram:).
This is just all IMHO. I don't know if there is a better technique to
achieve this, or if it is something that just is.

>
>I can't recall having lost e-mail.

If I move my Newsie from one disk to another, even after configuring
the new directory paths, I will loose mail. It's not really gone, but
for some reason the subjects arnt linked to the text files anymore.

>
>The only other problem I had with an earlier version was using UUE
>attachments: only able to do one per program start. It's OK with 0.90 but

I remember that:). I thought I had to disconnect from the news server
each time I decoded a file. That made it work anyway. No problems now
with the latest version, mime or uue.

>
>What it also doesn't do right is handling the article numbers upon
>transfer completion. Everytime I have to edit the Default.grp to prevent

>to do with the time-outs for this above mentioned problem.

I noticed that too. I thought it had something to do with my ISP. It
dosen't always happen. I never kept track of the articles to tell if
it was requesting "mark as read" articles or an ISP problem.

I would like the option to bulk download marked articles instead of
having to download the complete group, or hand pick out each one and
download one at a time.

My experience with the STacy is that the thing is almost bullet-proof. My
father bought one new, used it almost every day for 7 years, the sold it to me.
I have used it in a varity of abusive conditions (corrosive atmosphere, truck
moving along a gravel road, ect.), the only problem was a trace on the keyboard
broke about 1 year ago. It will be a cold day in H*** before I give it up
though.

It seems to be something else cause I've not this problem with the same
ISP. In fact the proxy on this ISP is a mess and it's usually better not
to use it. It's also reported by Windows users.

Hi Clayton,

any decent desktop (Thing, Jinnee) has options to set the fastload bit for
any program you'd like. Plus limit memory use if it grabs all. Also
options to use the fast RAM or not. There used to be separate programs for
it in older days (Pinhead) that you could configure to use fastload on all
programs or exclude the ones that didn't like it. I don't know Warp-9
myself but the box could do the trick or maybe it's just a fastload
setting for its own? If you run Thing you just click the program name,
next CTL-I and you select the "program" section to make your choice. Easy
can do!

Hi Pat,

maybe we've got clue nr.2 here: quitting Newsie before disconnecting...
I found that doing so Newsie always needed its time-out to disappear from
the desk. Therefore I made it a rule to always click the menu item
"disconnect from host" before "disconnecting" with Sting, and maybe that's
one reason why I never experienced problems after the initial ones...?
I know I'm wildguessing again, but for the time being I can't come up with
any better reason :-)

6721. recovering lost clusters in MagiC

Newsgroup: comp.sys.atari.st
Date: 1998-09-26 00:00:00 UTC
From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it
Message-ID: <5217_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 93097

I really need a program to check my partitions and recover lost clusters with MagiC. I tryed HP_Optimizer but it only recovers lost clusters loosing the data chains, I own Diamond EDGE but it detects all my longnames as FAT entry errors so it wants to correct them and I cannot save the lost cluster without doing it, so I would need something like HP_OPT but able to save the recovered clusters, or a newer EDGE, MagiC VFAT - aware.

Hi

Can anyone explain why when accessing a site to read offline the error message "Read Error in file K:\CAB\Cache\..." appears and yet a site that has been accessed before or since is still there?

It seems random. Sites haven't been moved into other themes, one day they are there, the next not.

Thanks

In the UK at least I'd guess that 99% of NEWSie users read news offline,
telecom and ISP charges mount up!

So what I'd like to see in later versions would be the ability to edit the
article overview offline for later selective retrieval at leisure without
getting one's hands dirty in the various control files, assuming that such
is possible.

Greetings;

I still have the following looking for a good home.

16 mhz Mega 4 with 2 mono monitors (one is tilt swivel)
2 megafile 30's loaded with productivity apps (many latest)
Internet ready
Migraph handscanner and touchup

Big box of software, docs etc.

I'd rather NOT ship since there is so much. Pick up in Owen Sound, Ontario
or I could deliver to Toronto
or Hamilton Ontario

Price $150 Canadian for EVERYTHING!

Regards,

Willard VanderPloeg

You're using MagiC for long file names? I believe it uses the same VFAT mechanism as Windows 95 and Windows 98. You might be able to hook your harddrive up to a PC and run Win95 and Win98 utils to seek out and clear or save lost clusters. I haven't tried this though, so I'd recommend a backup before you try. Beware though, that in my experience, any Wintel-oriented tools are usually either less thorough or simply less effective than the tools we 68K people are used to. I think it's worth a try. One such tool is a light version of a Symantec / Norton tool, and comes standard with Win95 and is called Scandisk for Windows 95. (scandskw.exe) Be careful not to use scandisk.exe (DOS-version, as even the one that comes with Win95/98 will destroy your VFAT-entries). I'm still wondering why Win95/98 didn't simply use NTFS or HPFS for long file names, or even just stuck to DOS and used descript.txt files or a similar mechanism. Would have been a lot less trouble.

Good luck!

>I'm really starting to worry...

How the h**l can you ask Uwe if he's going to "kill" every Atari shop outside of Germany? He's a very capable programmer who simply wants to get paid for all the time he puts into making and enhancing his software. If some idiotic company starts selling copies of his program, they've dug their own grave and have noone but themselves to blame! As a user and presumed buyer, you should blame them instead since they've abused the copyright and therefore lost the right to distribute the program.
The only right thing to do in such a case is naturally to stop delivering to them. I back Uwe's decision without any questions. For all I care, the bastards that sell pirate copies of HDDriver should be prosecuted for breaking the copyright laws, but that's something for Uwe to decide...
If all retailers were serious, you wouldn't risk loosing support in any country.

That's absolutely true. Charles helped me get up and running with my
(current) ISP which uses a PPP (with PAP) connection. Before that I had a
sort of "free" SLIP connection with another ISP that _I_ set up - originally
with STiK a couple of years ago without Mr. Silver's help - but if I had known
him back than, I bet the setup would have gone much faster!

And he did it on his own time and asked for nothing in return. Much like
Peter with STinG...

With the Mega STE, try to get one with TOS 2.06 (as opposed to 2.05 which was buggy-er).

>Futhermore I'm a bit interested in hardisk recording with Cubase audio and
>a Falcon. Apart from an Standard 4mb RAM Falcon, is there anything else I need
>to do this satisfactionally. (Presumably a large SCSI HD of.c. :)).

Hmmm. Yes and no.

First, you want to make sure that the Falcon has had a few hardware modifications done to it (and if you buy it from someone who used Cubase Audio, it should already have had them done). The most critical is the clock fix, which clears up some problems with recording audio (others here can give you more details on this one).

The other two are not _required_ but do really help out. One removes a "bass boost" that Atari put on the Falcon's audio output at the factory.

The other changes the Falcon's audio input to LINE LEVEL as opposed to the standard MIC LEVEL.

Other than that, 14 megs is best (a simple cheap 16meg SIMM will do it when combined with a third party memory board - also cheap).

And the largest, fastest HD you can afford. Actually, you can record audio to just about any SCSI HD on the Falcon, but if you try to have too many tracks running at once with a slow drive, you'll run into problems. I use a Seagate Barracuda 4.29 gig drive (8ms access time), and I've not had any trouble with even 16 tracks simultaneously.

And if you want to spend a little more, you might want to look into a digital interface, which would allow recording (digitally) from a DAT or CD into Cubase Audio, and also allows you to use your DAT's (or other) ADC/DAC converters. And then there are the ouput expanders which can give you 4 or 8 direct audio outs. And audio IN expanders are available too.

Of course, you can get along just fine with 4 megs and no extras. :^)

I'm still waiting for my NEMESIS board. Computer Direct (in Canada) _USED TO BE__ the official North American distributor. Now it's ATY Computer in Oakland, California. Alex (the owner) is waiting to receive more NEMESIS boards from Titan. When I spoke to him a couple of weeks ago, he told me they were expected at the end of this month (September).

Visit ATY's website:

http://www.virtual-markets.net/vme/aty/

The NEMESIS board itself is supposed to be under $150, and Alex charges around $100 for the installation (which is apparently quite complex).

Are you sure you have a different SCSI ID set for each drive?
This can usually be set with a little numerical switch on the back of the
drive(s). Set one to "0" and one to "1" (as an example).

Well, I got newsie .92 and am trying it out on my main system.

Atari TT/030 4meg ST ram 4meg TT ram 548meg scsi, 130meg scsi via dma port and icd host card.

So far the only thing I don't care for is the lower case lettering used with the file slector. I use UIS-III and to see the file is there to mark it, I have to click on the wildcard * to see the files. 92 crashed one time when I was playing with the font size, but that was because of my own fooling around.

Wonder if I could just move the address book file from .88 over to 92?

I was glad to find I could adjust the size of the screen text, that small text was a killer on my old eyes!

I'll second that. I had Alex Yu at ATY Computers install my Nemesis along with a 33mhz 68882 FPU (now 50mhz). After reading the docs, I'm very glad I let him do it. Its well worth the upgrade, once you use a Nemesized F030 you would never want to go back!

Now that I've said that, let me also say, that at this point in time, I would recommend you wait for Titan Designs next Falcon accelerator. Its called the "Tempest", uses Motorola Coldfire CPU technology (CPU running at 40-50mhz!), supports upto 256 megs of SDRAM (TT FastRam), and even has an AGP port! Also, its downshiftable for full '030 compatibility. Its price is provisionally listed at 199 pounds, which I think would work out to around $300-350 (depending-this will fluctuate). Its my *NEXT* big hardware purchase. Visit Titans web site for full details on this and other exciting products! (such as Eclipse-the PCI graphics adaptor card for Falcons!) ;-)

All; Sorry to fill the group with such crap, but what ever the unpleseant feeling
you get from reading just the first few lines, or the whole letter hopefully
will remind you next time you feel like throwing caution into the wind when
it comes to your hardware or cash.

****

Mr. John Perez,

Over two years ago I sold you a new Falcon motherboard from C-LAB,
imported by Toad, for the sum of $500.00 (a sum which you
were eager to pay).

I had tested the board for several hours and could not find
fault with it. The package was shipped to you, insured.

About one week after arrival, you said that there were problems
after you installed an FPU. My first thought was to check the
buffer modification. You put this off for a year. Then approxmately
six months ago, you requested I take a look at the board, two years
after it was sold to you. I agreeded to checkout the buffer mod. I
also advised that you really should send the board to ATY Computer,
or Wizztronics to be checked out. An inexperienced person can really
screw up a machine, especially a Falcon, in two years, and I didn't
know what you had done to the machine in that time.

Yet I agreed. I couldn't see what the problem could have been as
when I tested it, I installed an FPU and ran Scape882, the planet
scene generator without problem and also ran an FPU bench mark app.

Failing to find the problem, I agreed to send the machine to Wizztronics
for repair. You were in a big damn hurry then as you were wanting to
purchase an Afterburner and needed the machine. Including the time
I spent looking over the machine, the $65.00 shipping fee to Wizztronics,
or their $300.00 repair bill, I have lost all the money I had paid to
Toad to in the first place. You agreed to split the Wizztroincs bill,
for either $150.00, or a Falcon NOVA adapter you were suppose to ship
over three months ago. FYI, the only problem with the Falcon was
a the chip select line for the FPU was bad. This could have happened when
the board was shipped to you in the first place, when you installed
it into your Falcon Rack case, or when you installed the FPU. Wizztronics
did replace the FPU socket, so the damage could have occured at that
point when you installed the FPU chip.

Now all of the sudden, you disapear from the Atari newsgroups, and do
not reply to your mail. You did say about two months ago you had the
adapter and only needed to get to the post office. Where the hell is

the post office in Hawaii? Inside a damn volcano? I do have your home number, I could easily get your work number. You will start getting calls at work if I don't get payment or the Adapter very soon.

Now, lets take this a little further. Your friend Chris bought a TT from me with a 19 Moniterm moniter and an Axit TT Ram card for the sum of $400.00. Considering the cost of the ram card, he got a good deal.

Before the sale, you said that he wanted the machine to run Norator on. I told you I don't know anything about that application, but I had used the TT for a couple of years without problem, using many external devices such as an ICD Link, ScanX and an MicroTek scanner, Chronos 3D and dongle and VideoMaster ST.

You assured me as Norator ran on your TT that it wouldn't be a problem. Fine, deal done, package shipped to Chris. The next thing I know is you are on the phone saying the application and dongle only works for a short time, then the machine crashes. You actually have the machine torn apart trying to find the problem. You don't even have schematics, so what the hell did you think you would find. After a couple of weeks of phone calls and emails, you tell me that you and Chris are "Very depressed" that there is a problem with this TT. That is even after Alex at ATY told you that the TT and Norator have problems and are not considerd compatible. Wizztronics was a little more consertive and said that maybe one in ten TT's would work properly, a lot depending on the version of motherboard you have. Of course, you know more than them, and dicked around inside the TT further with only a phone call to me as guidence. Real technical approach there. You actually had the balls to ask Wizztronics to send you ten motherboards to check out, and send the rest back after testing. This came out of Wizztrtronics mouth directly.
The one and only mail I got from Chris said that "John said you helped him out and I was wondering if you could help me out as the TT is usless for what I need. It is currently in stroage."
I'll bet it's in storage. Do you even know what was fried after you got through screwing with it?

TO ALL A WARNING: DO NOT PURCHASE ANY TTS FROM HAWAII NO MATTER HOW GOOD THE DEAL SEEMS TO BE.

I replied to Chris's email. I stated that I would purchase the TT back, he pays return shipping. I also wanted the hardware first, and time to check everything out before returning payment. I couldn't hold this offer long, so I set an experiation date on the offer. The date came an went. A few days later you mailed me and wanted to know if I had gotten hold of Chris. I told you I mailed him. He said that both or your mail servers are screwed up and I should remail the offer. Funny, two seperate ISPs with the same problem at the same time in the same state? Boggles the mind....

Rant mode on: People get pissed off or suspicious when someone selling an item here wants a guarnteed form of payment in advance before shipping. It's assholes like you that cause this. The list of dubious people in the Atari community is small, but you just made the list. Congrats!

I expect my cash or hardware soon.

Ok, I was trying out newsie .92 and so far I've had one thing happen,

I logon with STinG, run Newsie, pull down mail menus, highlight 'Get Mail' newsie makes connect and downloads mail, displays list of messages ... I read and do my replys with newsie sending them out, so far all is fine. then after last message is read I close e-mail window, mouse pointer moves but NO MENUS COME DOWN, program is locked up, can only get out via reset button.

>But with MagiCMac I can get the best of both worlds!
>

Oh,- the Mac I have here works fine, but maybe yours are a 33 MHz?
The one I got is only 25 MHz and I did expected this 68040 to be
faster than the 68030 build into the Falcon.
Must be the software then. The Os 8 is kind of huge.

I`m looking forward to get MagiCMac one of these days.

I wouldn't mind one of those either. I'd also like a prog that lets me
save out the separate frames in an AVI/MOV. At least then I could use
something like MPEGFever (when I get the compression util) to make the
MPEG.

Ahh, we already have that ability. M_Player will do quite nicely for
that (disassemble) and is fast.

Mike

Actually, Aniplayer allows you to save individual frames (video
only), but it would be tedious to save all the frames from an entire
file, unless it was really small.

That Warp 9 setting is the same as using Pinhead. IOW, it has
Pinhead built-in (both programs have the same author, Charles F.
Johnson).

As I recall, the "Sparrow" was a prototype of a "low end" Falcon.
I think by the time the Falcon was released, it was low-end enough that
the Sparrow was never put into production. It's also possible that the
Sparrow prototype itself actually evolved into the Falcon.

6752. 2nd midi port on Falcon

Newsgroup: comp.sys.atari.st

Derryck, I have tried both the st and the TT versions, And they both run
fine as long as I only output to the screen. As soon as I try to output to
the printer, it gives me two bombs, when I try to change the output device
to my dj550C (actually a 672c). Do you have any idea what I may be doing
wrong?
It doesn't matter whether I try to change it with the options menu or the
output menu.

No, there's a second way: Cubase Audio is (was?) also available for ST/TT, but
then a Yamaha HD Recording machine was needed (something with CBX5 or so...).
It's connected to any Atari and runs 4 track HD recording.

Not that works 100%:).
I wouldn't mind a .TTP that would compress an AVI or MOV to a compact
size.

Ciao alessandro, the Atari st as any other computer running Cubase or Notator logic or similar MIDI programs transmits program change, simply because this is a standard MIDI code. I use both Atari ste and PC with Cubase with the same results and total file compability. You also can connect a MIDI keyboard at the Atari midi input, while you connect your midi expanders like your dr660 to the Atari midi output.
Is it clear? Ciao

Carlo

Thanks, John, for reminding us of this feature: memory often fails
when one is in the middle of a session. Thanks too for the *great*
improvement in v 0.92.

So what does File/Save do in the midst of a downloading session?
Does it prevent losing articles/posts if there is a crash etc?

Cheers, Charles.

>Wilfred Kilwinger, Jurek Ceglarek, whoever from former Atari Netherlands,

Okay these names are known. (I've also heard that Wilfred went to Vobis and
once was a Commodore guy?????). I think it wasn't such a good move by Atari
USA to dismiss Alwin Stupf of Atari Germany, IMHO. He did a lot for the
"professional" Atari market (yes I know, USA wanted into the consumer
market).

I once bought a Falcon there when I turned in my 4MB STE. Although it took them about four months to get their act together, in the end, I did end up with a Falcon according to my specs (of back then).

The dealer thing isn't that much of a problem to me as long as I can mailorder things. What hurts me most is that so many reliable and less reliable Atari mags have either disappeared or become hard to come by. Examples: Atari Magazine, Atari Info, ST, some belgian thing that made it to the Netherlands once and was completely made on Atari (I think it was called 1st something). Then there's the British glossies ST Format, Atari ST User, Atari ST Review... and my biggest loss... the gradual disappearing of several German mags (especially the ones with techie bits). Atari Magazin, TOS, 68000er (merged with ST Computer if I'm not mistaken). Does ST Computer still exist? IMHO it's still one of the best...

I really need more and better subscriptions...

What I miss on the net is something like www.atari.nu, only for third-party hard- & software dedicated to Atari.

Thanks for your informative reply,
Werner Domroese / Q5

6766. Falcon's 68030 (was: Re: Atari Sparrow)

I.C.
>The Falcon's 030 is a custom-made piece for Atari with only 16-bit
>bus. A real 030 has 32-bit bus and dynamic bus-sizing.

Then why use a 68030 in the first place? What's the difference between the
Falcon 68030 and the Amiga 1200's 68EC030?
Do you mean the actual processor or the hardware around it? From what I
understand, you could theoretically place a genuine 030 into a Falcon
without any problems, but it's the bus interface between the CPU and the
rest of the system that's 16-bit on a Falcon. Sort of like a 386SX PC (in
which case the processor really had that limitation of 16-bit bus to
external hardware, unlike a 486 that's hooked up to a 16-bit bus...)

This is very confusing for me. If you'd care to clarify, please do! :-)

File/Save is mostly used to save the currently loaded newsgroups
(.GRP) list. It automatically saved at program end, or when another
newsgroup list is loaded, but yo umay want to save it any time.

I'd have to look at the code to see if it does anything else.

Sorry no quotes here, meant for anyone who reads it :-)
Well, perhaps it's a comfort that the users of the 32-bit extensions to a 16-bit patch for the 8-bit operating system written for a 4-bit processor by the 2-bit company that cannot stand 1-bit of competition have the same problem with MTU values.. in fact it's so HUGE that there are several dozen utils to fix it..... :-)

My Atari does more than games. In fact, I use the PC for games ;-p

These short timeouts occur because a post _just_ arrived on the news
server while NEWSie was downloading for offline use. Babel (FireNEWS) and
NEWSwatch never pause for these new arrivals, perhaps one of the reasons
they haven't caused any kind of file corruption for me. The NEWSie
timeouts almost appear as interruptions, because this often meant that
some form of corruption would occur afterwards (usually the default.grp
file, sometimes the partition used for the offline path). My contention
is that NEWSie's 'immediate', for lack of a better word, server
interaction causes problems with some users.

AFA a used Mega STE: check the keyboard. The contacts are on a mylar
which wears out irreparably over time. Mega ST keyboards will substitute
just fine, but they are not so easy to find. When the Mega STe leyboard
statrs to fail, the CONTROL key stops funtioning, then the F1 key goes,
then others follow.
Systems for Tomorrow in Missouri has replacement mylars which you can
self-install with a bit of patience.

That's my recollection, too. It placed the names of the running
programs in the ACC menu, underneath your ACCs, so they could be
switched by clicking on them like ACCs. I had it for awhile, but
never used it much (as I recall, I just didn't have the memory to do
anything with it), so I sold it.

Yes indeed, this is possible if you buy the adapter Mario has just made.

It is suitable for STFM and Mega computers.

It allows connection of IDE hard drives in 2 1/2 inch and 3 1/2 inch
sizes.

I believe it may not be officially launched yet, but I have seen it and it
works fine.

He has some other amazing projects planned.

Indeed, if you have any ideas for hardware to make you should contact him

GSM phones are 9600 bps with a 16MHz - 16 bits DSP to compress/decompress the streaming sound in realtime. There is no reason why the falcon can't do at least as good as that.

> That's ALL what I think. Please prove me wrong. That's a very

The falcon *could* do some streaming audio/video with a falcon-aimed compression scheme. But it's true it'll have troubles doing what a P120 is just enough ;-)

(anybody want's such a video compression format ? I didn't work yet on the audio)

Well, he must be doing a lot more right than I am. I've downloaded 3 big files and put them in a folder, and I can't get Ghostscript 5.10 to run. I get maybe 9 bombs... goes by pretty fast. What am I doing wrong? I'm using a Falcon/ Nemesis/ TOS 4.04. (I got the 030 version). Do I need to have Magic? Maybe I could just cast a small spell to get it to run for me. Perhaps my folder configuration is wrong? I can't even get it to run so I can set any paths, preference files, configurations, etc. There's a GEMGS.CFG file that comes with it. Maybe someone could email me their's, or even post it as it's quite small. Any help would be way cool.

Thanks,

Clayton Murray

6778. CAb Problems getting internet-pages

Newsgroup: comp.sys.atari.st
Date: 1998-09-27 00:00:00 UTC
From: chimdjgh@sp.zrz.tu-berlin.de
Message-ID: <6ul7io$7bf$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 93047

After trying for hours and days I decided now to ask
the Newsgroup. I wanted to use CAB 1.5 to browse and see the
pretty pictures out there in the internet, but it does not
work. Installing, enabling and connecting STIK was easy and
I can use aftp (sometimes freezes), IRC, Antmail and Newsie
66 (exept the html feature!). www131 Internet package CAB
didn't work and CAB2DEmo crashed on my old Mega 1 (old
Blitter TOS1.2) so I used CAB 1.5 with ovl and finally I got
the CAB Homepage.

But any time I try connecting to an URL -adress it it shows
"resolving" and I get a blank page. No Data is transmitted.
After this "Session" i will find Something an the CACHE-foldr
with 0 Bytes.

Did anybody with old TOS equipment get an internet-page on
CAB 1.5??

Any Help would be great! I don't want to buy such a nasty DOS
machine.

THanks for reading.

Christoph Chi

SCSI: didn't the Mega STE and the TT also have that????

Crippled? No way the Falcon has a genuine 68030, AFAIK. Bad thing that they left out the optional 68882 FPU, which was standard on a TT. Too bad the TT/X never made it either. Believe it had the same graphics specs as the ATW800. If you refer to the 16-bit bus, that's the REST of the system (as opposed to the TT, AFAIK). The Falcon was indeed intended as the successor to the STE's and the MicroBox, the high-end version of the Falcon, as the successor to the TT's. I think it featured a 68060 and five VME slots (according to a Dutch Atari mag).

And the TT's successor supposedly had to be the MicroBox. 5 VME slots,
68060, fully 32-bit and a high bus speed (or so I've read in Dutch Atari mag
Atari ST Nieuws)

Hi,

well, I discovered that turning all the "log options" to off does NOT mean
there's no more logging... :-)
I wrote another article a few hours ago, but on the last login it didn't
show up in CSAS... maybe later?

Anyway, here's my last experience: just fetched another series of articles
(21) in another NG and 5 times I saw the counter hang at the end of the
article. When looking at the groups overview window, Newsie displays a "4"
before the group name... (that's right after read for offline). Checked the
Default.grp later and it was 4 numbers behind...
All the articles "looked right" to me, they showed up complete.

Good, so I've gone back to Wdialog 1.98 again, now the nicknames edit can be
selected and so can the "mailbox" button in the Mail window. With version
2.00 that just both led to a crash here (read: MagiC "fehlermeldung", next
back to the desktop). And again, here a TT030 with MagiC 5.01.

John, maybe it's wise to have yet another option available: "No logging at
all". I still believe the major problems stem from this feature...

Source record: 93052

In an issue of Dutch Atari magazine "Atari ST Nieuws" (E-mail:
ataristnieuws@acn.lu) they covered a topic on the new Atari MicroBox,
supposedly the high-end Falcon.

Here's what they said:
Sparrow was the project code-name for the new generation of TOS machines,
namely Falcon030, Falcon040 and MicroBox.

What else was in there?
-They showed a photo graph of a MicroBox casing thoroughly different from
the pictures of Curt Vendel's excellent www.atari.nu and claimed or stated
that it had been designed for the MicroBox by Apple designers. They left us
in the dark wether these were ex-Apple employees or that there was an actual
agreement between Atari and Apple.
-They roughly outlined the history of TOS machines and video game consoles
-It featured some info on a supposed prototype of a Mega ST that featured a
built-in genuine PC, hardware-based PC emulation or PC compatibility
(depends on how you interpret the article). It was rumoured to be dropped
because before the IBM / Jaguar agreement, Atari would secretly have used
some IBM patented technology for this compatibility.

The mag doesn't give much credit listings, but it's also a mag from the
official Atari distributor in the Netherlands after the big reorganization.

Project Sparrow is said to have been a taskgroup and yes - the "Sparrow" a
working model. Along this way, new computers were to become birds of prey
(Sparrow, Falcon) and game consoles to be predatory mamals (Lynx, Panther -
which was dropped due to advances in Jaguar technology, and Jaguar). The
Sparrows were developed in the US, the Jaguar as we all know mainly by Flair
and Flair II, Atari-funded british researh companies.

Atari did a lot of this stuff. For example, the ATW 800 operating system
came from the same people that developed the Amiga operating system. The
Portfolio was a licensed product that I believe was also manufactured by the
company that originally developed it. Transputer technology is also said to
be used in IBM's parallel transaction server, which also used T800's but ha
a different OS. The ATW on the other hand, was built around a Mega ST for
Atari peripheral and software compatibility and used a GEMDOS file system
(well, that's what I've been told), but featured Unix-like features, but
unlike most Unix flavors, true parallel processing (which is different from
basic multithreading and multitasking with timeslices and such).

Well that's all that's known to me, but of course I could be just as wrong
as my sources. Worth contacting the AHS / Atari Vaporeware / Curt Vendel
for? I think it would be interesting to have some real facts on these
things. Maybe www.atari.nu have some docs on it. Who'll know?

I'm moving right now, so Curt if you're reading - it would take some time before I find the issue again. Then I could scan and/or translate it for you and send you some mail, if you'd like. I don't know their credibility. You'd have to mail them on that (ataristnieuws@acn.lu).

Werner.

Hi Werner,

well, this magazine has launched some crap at several times in the past :-)

I reckon about 2 years ago they did an article on this Microbox,
suggesting Atari was still secretly working on it and launching it as the
"Atari-Phoenix", complete with "secretly obtained photographs, which
weren't all published because the big shots in Sunnyvale had threatened
they could loose certain rights when they did" (Quote from one of the
editors when I spoke to him about it).

One of their "authors" still is some "wizkid" that once was kicked-off a
mailer system because he didn't want to comply with echo rules. Called the
Semper/Jetmail/LED packages crap and he could write a much better one in a
fortnight. Same kid tells people in May/June '98 that XaAES is a very good
and stable OS, from programmer "Cray Grahman" and "now available at
version 7!"...

Go figure!

> official Atari distributor in the Netherlands after the big reorganization.
>
Well, they NEVER did list any credits...
Being the "official Atari distributor in the Benelux"... here's what
happened:
In the reorganisation of the whole Atari bunch, the Belgian offices were
closed, the Dutch ones got a smaller housing (I recall they went to
Schiphol airport in their final days, sitting in a warehouse instead of
the former office building). I gather at the end also the German branch
was closed, and so was the Dutch one. The next day ACN drove to Schiphol,
bought a few pallets with Atari-ware and proclaimed themselves the
"Official Atari Distributors for the Benelux"... whether that was with a
licence from Atari Sunnyvale or without is not clear to me. Wouldn't
surprise me if Atari USA never knew a thing about it :-)

Some time ago it appeared they were selling Gemulator boards: re-makes,
and the official producers never saw any fees. (Hey Uwe, you're doing
business with them too?)

They reviewed Papillon 2.5 as a completely redesigned package, "capable of
running in all the modern resolutions"... Well, more than 256 colors
appearently was too modern :-)

Just told you about the review of XaAES v.7, which in turn was a "rewrite"
of the article on v.5 in Feb. '97 with the same misspellings...

They sold (maybe still sell) SM-144 monitors... the ones Atari Netherlands
had rejected, sent them to Poland for an "upgrade" and one is sitting next
to my old ST. Picture ain't bad, but not real good either. BTW, it came in
a box that appearently had been opened/closed at least a dozen times :-)

OK, 'nuff said about ACN...

I need to clear out my closet and I'm selling all my Atari stuff starting with the mags.
I have several ST Format issues between '92 and '96; issues 33-36, 39, 46, 56, 60-62, 64, 66, 74-77, 80-84. Only $4 ea. + .50 shipping. Or make me an offer on several. All but 56 have original cover disks too. 33-36 & 64 have two different disks per issue. I also have one STF binder which neatly holds 12 issues that I'll throw in if you buy 5 or more issues.
I also have Atari Computing issues 1-6 w cvr disks for $5 ea. + .50 shipping.
I also have many cover disks without the mags.
I also have software galore as well as hardware.
If you're interested in any of the above drop me an e-mail for further details (like my address) including magazine topics.

I download for reading offline with a 28.8k modem onto a RAM disk. In practice, I find it quicker to download everything then select/skip offline than to examine each header online. Would downloading headers only, followed by downloading selected articles, be much quicker than downloading all of the whole articles?

I'm getting occasional folder corruptions- this week, mail download wiped the whole of my MAIL folder and started it again from scratch- but I can't pin it down to anything specific. I have logging turned down to minimum. I backup the Newsie partition to a Zip drive after -every-session- it's saved a lot of grief.

Hmm this thing makes you wonder. But with almost no mags truly available in the Netherlands anymore (apart from "ST") by Stichting ST, or AFAIK, this really gives me a very bad feeling indeed.

It's true they sometimes claim things that aren't true and they sometimes scam in certain products and they never ever said a word about JTS or Hasbro AFAICR, so I guess you're very right about that. They do however, have some advertisers that still sell Atari items in retail in stead of meailorder, so I guess that's what I'm subscribing for. The fee isn't that high either, so I'll take it for what it's worth.

Perhaps you're right. I'm still very eager to their sources, btw, regarding the MicroBox thing. Is their German stuff also illegal?? Yes I know they still sold the old Gemulator when Gemulator 98 was advertising on the net. I don't want to give all those people a bad name unjustifiably though. These things are the reason that I state that something was "according to", and not my own experience (that many times differ from what others have to say about anything).

Then there's the newsgroups for info. Especially the German ones of MausNetz (maus.sys.atari. ...) seem pretty active. So if you have some more info on other sources (non digital sources included), they'd be welcome.

PS - It does take ages to get in contact with them every now and then as well. Do you also have an opinion about MABN? Are they trustworthy? (Closest thing to Capelle/Rotterdam) if you don't have a car...

:-)

Thanks.

Yep, Newsie looks really good.

Hm, you can get some benchmarks from my machine.
I don't know how you can get it in USA. I take my first one from titan
directly..

After a smal waiting period of 5 months after ordering..

(Same time i also waiting to get my apex disc back from them..) :(
(I send it last may for updating..) Bad service, really bad.
(They don't answering fax or email) !!

Yesterday i got an CENTurbo2 from CENTEK. Delivery time: one week!

Sure, it's expensiv, but faster as nemesis, CENTEK use a new CPU and
two 32 bit bus systems. End of the new week i fit one falcon :)

Report follows if you are intressed.

Both, nemesis and centurbo need some solder jobs..
Critical points are DSP speed up and videl clock. (very smal solder points)

If you are following straight the manual you can't damage your falcon.

(Better to use the fitting service if you don't understand all points
of the nemesis or centurbo manual) (both in english leanguage with pictures)

Thank you.

More as 10 emails and two faxes are not enought
for Titan to send one answer?

Remember the time, i send my disc in may 98'

AND that's not the first touble with them!
But i'm sure that was the last.

The one and only, i try to get back my disc, with or without update.

Regards, Robert

6803. VT52 Problems

Newsgroup: comp.sys.atari.st
Date: 1998-09-27 00:00:00 UTC
From: apm.byl@thefree.HAIRnet
Message-ID: <360e2fcb.1947924@news.thefree.net>
Source record: 93072

If run a TOS program under MagiC v5.11 and VT52 is not already loaded then VT52 will load and open a window running the MCMD command line shell. There is then a slight pause and then the TOS progam will run in full screen mode.

If I keep VT52 loaded then any TOS programs will run in windows. If I quit from VT52 then the original problem will recur. Is this a problem with MagiC or is there a way of getting the first TOS program to run in a widow rather than in full screen mode ?

Well, I was looking for Appline (for MagiC) but found Multistrip instead...
here's another program that knows how to use the AV-protocol and another
reason why I prefer Thing's fontselector over all the others: select the
font, *plus the color you'd like* and drag it onto the strip. Hey Presto!
and your font is done in the color you want it. Same for the clock strip
and the Caps light.... And out with the bloody CTL-ALT-ESC sequence to
kick out non-behaviours...
Who said Win-98 was the ultimate OS? Can do that on a system with only 4
megs if you like, without the need of a 1 Gig drive... :-)

Gawd, I love this TT!

I was wondering the same thing after a colleague in work got the CD.
I'm waiting to here a report from him, but I suspect it's like AOL or
Compuserve in that you have to use their software and go via their
on-line service. The CD says that a PC is required.

Or I may be wrong.

>Seeing that you're Danish I'm sure you will meet the same problem but
>there is bound to be a solution somewhere -perhaps Indigo 2 in
>Copenhagen knows...

Don`t know if it will work on a Mac running MagiCMac, but to get a danish
keyboard layout, I use Simon Poles old keyedit prg. The one that came with
Uniterm. Just drop the edited KEYBRD.PRG into the MagiC start folder.

BTW,- Indigo 2 is located in Aarhus. It`s the only Atari source left in
Denmark. And Heine Svendsen is very nice to deal with.

>

>
>
Hi Walter,

(I gather this was directed to me, since I saw no quotes at all...)

First of, I don't think they'll get impressed... Call it "not worth a
shot" or whatever...
Talking about the german stuff: really don't have a clue. That's the
reason I yelled at (well, better call it: "warned") Uwe...

Most stories come from inside the old Atari world. If you ever bump into
Wilfred Kilwinger, Jurek Ceglarek, whoever from former Atari Netherlands,
you'll probably hear more...
The Gemulator-thing was something described in the FAN-net about one year
ago... I recall having seen a posting from the makers of Gemulator with
the story attached.

Atarians still do exist over here, the trouble is, you see very few in
this NG. Some of them call themselves "die-hards" but they surf on the
Internet by means of PeeCees, Macs, etc. and don't even know you can do it
on an Atari. Won't read in CSAS because "there's somuch flow"... ? You
call that "die-hards"?

Well, MABN is another story: it primarily is a firm that sells timing gear
for indoor-skelter-circuits, but it sells Atari related stuff too. One guy
(Paul) knows about Atari, the others only know it ever existed. Paul
managed to have a pre-production Milan (board nr. 5) tour several
interested people over here, for evaluation purposes. One time I ordered
NVDI-for-Matrix, never heard a thing, so I got it straight from the
Behnes; early this year I ordered and paid for a new Aixit board with 64
Megs for my TT. After 3 months I told Paul I didn't like their handling

(no messages about delay or whatever) and he refunded the money... Let's just call it a "minor slip". Heck, they're the last dealer over here I know of. At least they appear to be very active on the Milan front.

>Is there any info available on getting these two drives running
>simultaneously?

Generally with this type of problem on SCSI drives, it tends to be a
clash of ID numbers. On the back of each drive, there is usually a
single digit in a window, which can be changed using a couple of
buttons beside it. Basically these numbers have to be different to
each other. Change one or the other and you'll probably find it all
works.

Cheers!

James

Sounds like the problem I had again. Check that your ISP is not
filtering your service. If you want it filtered, then you have to set
up some proxys in the CAB preferences (and maybe also also in your STiK
files ?). I just got all the filtering switched off and ignored the
proxys, then it worked fine !

You are a bit wrong. It gives you a proper internet connection, you can use normal internet apps, however you need a web browser which supports secure connections in order to sign up, I don't know how well CAB would cope.

Source record: 93087

Garage Sale:

1) Atari 520STfm computer with internal DS/DD drive, stock mouse and QMI DeskCart plug-in clock/acc cartridge upgraded to 1 Meg (the work was done *several* years ago by a member of an ST users group I used to be a member of - chips soldered directly onto the motherboard, equivalent to a 1040STfm in all respects 'cept for the logo..) Excellent working condition, and EXC cosmetic condition as well. Still have orig box, TV adapter and manual. $50*.

2) Atari SM124 mono monitor. Excellent working and cosmetic condition. $25*.

3) Pico Products 5-way power switcher/swivel base (beige in color - not an exact match for the ST, but close - looks cool, works great. $5*.

*Buyer prepays sale price plus UPS ground charges from 70806 to destination (actual cost only, I can ship from work.)

Will sell within the US and prepaid ONLY - UPS costs will be material, and I don't wanna get burned on COD.. Have plenty of netrefs, and decent eBay feedback, though I'd prefer not to list these items there.

Please note - I'll sell either the SM124 or switcher, but not the computer, separately. Heck, buy the CPU & monitor and take the switcher free..

Serious inquiries welcome. Thanks for looking,
Bill

The next meeting of WAG (Wessex Atari Group) is on October 24th, 1998, at Whitchurch Fire Station, Whitchurch, Hampshire, England (10-15 miles south of Newbury).

Please feel free to come along - transport may be arranged depending on where you live. There is a train station at Whitchurch, feel free to use this service.

The meet starts at 2pm and goes on till 7pm or later ... ;)

For more details, contact Roy Goring on 01705 611847 or www.users.zetnet.co.uk/rgoring/wag/

Even if you are a member of another group (SHAG, CAG, etc), if you can make it down to WAG, so much the better !!

Richard.

Hi Neotronic - I tried to E-mail you this but it was returned
undelivered. (They could not find your mailbox.)

On 27 Sep 1998 07:03:25 , Neotronica wrote:
>
>2)When was the *last* atari with midi capabilities made?

Not sure, but if you count the latest "Clones" - the "Hades", the
"Medusa" and very soon to be released "Milan", then they are still
available. The Hades can certainly have midi ports, I imagine the
others can too. Cost a bit 'though !!

>3)which atari system and software is the best for using as a midi
>sequencer/recorder?

Just about any of them, although with the 2nd-hand market as it is,
you may as well go for at least an STe. Make sure it has 4meg of Ram.
That is usually plenty on an Atari if you just want to sequence midi.
You really will need a hard-disk as well. There are plenty
around. SCSI external drives work well but you need driver software
and an ICD link (this converts the Atari ICD "language" to something
SCSI understands). You also need a Hi-res monitor, but you may well
find a complete set-up somewhere.

A Falcon is a good idea. It may well have a built-in internal drive,
and it also has the capability to record audio - although you need
quite a massive hard-disk for this.

I thoroughly recommend CUBASE as a sequencing programme. It can be a
bit expensive new, but it is still easily available in the U.K. Do
not be tempted by cheap "cracked" copies which supposedly work without
the dongle (a software protection device that plugs in to a port in the
machine) they just give grief !

Latest version of CUBASE is CUBASE SCORE 2 r 7, but there are earlier
versions which work well. Anything from 3.01 onwards should be fine.
It is a professional programme which was used for years in lots of
music studios. (Some people have had difficulty with CUBASE on a TT,
although I gather it can work well.)

Cubase Audio for Falcon is the answer if you fancy digital recording,
but the Falcon may need some mods that I do not about.

Let me know if you can not find a copy, I will give you some names.
There may well be 2nd hand ones around - you could try asking some of
the sequencing Newsgroups.

Good luck !

Paul

I haven't got an old TOS but a Falcon, however I got this problem when
I tried to install the "Falcon-specific" version of CAB.OVL. So I
would say make sure you've got the latest version of CAB.OVL, this
might be the problem.

>
If it doesn't happen every time, then it does happen randomly. I
haven't seen it, or if I have I have chalked it up to a variety of
things including the state of my machine, the network, power
fluctuations, etc.

If it has happened since 0.86 or so, maybe it is an unusual problem,
but that makes it even harder to catch.

Question: Is closing the Mailbox window the last thing you do? I
need to know the specifics to know where to look.

I would appreciate it if anyone can explain the problem I am having on my ST. I have an old 1040ST and Notator software 3.1. Last night the program would not load (and I have used it for years with no hitches). Instead, a abort message came up: FATAL ERROR MEMORY PANIC (3). I have no idea what this means and do not have the foggiest where to go from here. Other software loads fine so I am assuming its a software problem in the Notator or dongle or something. Any advice greatly appreciated. I am lost without my sequencer.

I'm interested in buying the following ST software:

1) Games:

- Zynaps
- Ikari Warriors
- Cybernoid
- Xenon

(also interested in parts II, III, and so on if exist)

2) Utilities:

- Degas
- Devpac
- Easy Rider
- Neochrome
- Resource Construction Set
- Spectrum 512

(only latest versions)

* NB: Only original, complete (w/ box & manuals) software please *

Also interested in the following books (titles not accurate):

- Digital Research's GEM reference (and related)
- (any GEMDOS, AES & VDI related books)
- Disk drives inside & out
- ST internals

I remember before the Falcon came out anmd there was a lot of buzz
about a new mid range machine (between the STe and TT) The rumour was
an 020 based machine at 12mhz with a Motorola DSP and an enhanced
version of TOS 3.xx. The codename was Sparrow. Later that year at
one of the shows in Germany there was a prototype with the Falcon
specs, as AtariUser put it "the working name is sparrow"

Last-modified: Wed, 23 Sep 1998 21:05:04 CDT
Maintainer: Chris Lawrence <faq@linux-m68k.org>
Posting-Frequency: bi-weekly
Archive-name: linux/m68k-faq
URL: <http://www.linux-m68k.org/faq/faq.html>
Current-FAQ-Version: 2.0.41 (Sun, 20 Sep 1998 23:32:22 CDT)

-----BEGIN PGP SIGNED MESSAGE-----

Linux/m68k is the version of Linux, a Unix-like operating system distributed under the terms of the Free Software Foundation's GNU General Public License, for computers using the Motorola 68020, 68030, 68040 and 68060 CPUs. Current releases support Amiga, Atari and various m68k-based VME systems from BVM and Motorola; porting efforts are underway to the Apple Macintosh and various 680x0-based workstations (at present, the HP 9000/300 series, HP/Apollo Domain series, NeXT and Sun 3 series). Efforts to port Linux/m68k to other 680x0-based systems are also encouraged.

The purpose of the FAQ is to answer common questions about Linux/m68k, in the hope (infinitesimal though it might be) that those questions will not be asked again (since they've already been answered in the FAQ). It is highly advisable to read the FAQ thoroughly before asking questions about Linux/m68k in the newsgroup, on the mailing lists, or directly; failure to read the FAQ in its entirety may result in either no response or an extremely hostile response to your questions, depending on who you ask and what mood they are in.

The current, complete FAQ, including information on the specific models of these computers which are supported, is available on the World Wide Web at:

http://www.linux-m68k.org/faq/faq.html (The Netherlands)
http://ftp.uni-erlangen.de/pub/Linux/LOCAL/680x0/FAQ/faq.html (Germany)

It is also available at mirrors of the Linux/m68k Home Pages; see http://www.linux-m68k.org/mirrors.html for a current list.

See Section 1 of the FAQ for links to translations of the FAQ to various printable formats (including PostScript, Adobe PDF and DVI).

The plain text version of the FAQ can also be found at all Linux/m68k FTP sites and mirrors as "FAQ" or "FAQ.gz" (compressed with GNU gzip).

Christian Jacolot a traduit le FAQ en franï¿½ais. On peut le retrouver ï¿½
http://web.cnam.fr/Comp/Atari/Linux68k/Faq/

More information about Linux is available on the Internet at
http://www.linux.org/; the Linux/m68k Home Pages are located at
http://www.linux-m68k.org/ (and several mirrors: see
http://www.linux-m68k.org/mirrors.html).

Yes. TT030, Magic 5.11, WDIALOG 2.something and Newsie 0.92 = 2 bombs
when accessing the Nicknames dialog.

Upon removing/rebooting without WDIALOG, the nicknames works fine.
Jury's still out whether this has any effect on hard disk cluster
corruption/loss.

According to Steve at Wizztronics, they have several Sparrows. Each is slightly different than the other. From what he said, here are some of the features, and lack of, compaired to a "production" Falcon:

1).The most significant difference is in the sound matrix. The ones he has have a sort of a daughter card for the sound system. It works, but he doesn't know if it is compatible with "standard" Falcon audio software.

2). The DSP is a PGA socket as are most all of the chips on the board.

3). CPU (MC68030RC30) is a PGA socket.

4). FPU is a PLCC (like a normal Falcon).

5). Sparrow TOS is contained on 2-1mb eproms. It is different than Falcon TOS. Compatibility is unknown, and they have the source code for three different version of Sparrow TOS. They are machine dependent, meaning that there is a version for each machine.

6). The Sparrow has normal SCSI, Serial, IDE, Parallel ports.

7). The bus decoding GALS are different.

8). It has a single simm socket. I would image is to be a 30 pin socket meaning unless you can find a 16mb 30 pin simm (not impossible, but expensive) your stuck with 4mb of ST ram.

9). CPU Expansion is the same, but again, the GALS are different, so there may be hardware conflicts for goodies that you stack on.

I wouldn't mind having one to hack on. It would be much easier to try different modifications and develope hardware on a machine with socketed chips. With a Nemesis, you could install a 50Mhz 030, install a 66Mhz 56002 DSP and have a nice setup for something like Apex Media. The big drawback would be the Sparrow TOS. I would image that there is a lot of compatibility issues that would come up, and you would have to a good deal of programming experience to over come these.

I've been trying to get my hands on one for a couple of years...

Good Luck,

Mike

I'm just now learning about the sequencing capabilities of Ataris and have some questions:
1) What are some good webpages for info regarding using Ataris solely for music/midi purposes?
2)When was the *last* atari with midi capabilities made?
3)which atari system and software is the best for using as a midi sequencer/recorder?
4)If anyone has any info they think would be helpful to a new guy send it!

Please email me any responses

Thanks,
Neotronica

I'd like to see an ICQ type program! I use it on my PEE CEE, it is a GREAT,
for a Windoze program.

You can not join using an Atari - you can not join even through yuour current connection.

You will need their CD to join up - the CD which only works with Win 95 and NT - it installs IE4 on your computer and if you already have it installed then it changes all the settings.

So - answer to your question - you need the CD and a PC to join up and once joined you can use and Atari.

>everthing up yet :-/

Hmm ... perhaps they don't want to operate this way. I see that you
can just pick up a CD (don't know whether they have it on floppy) if
you go to a Dixon's, PC World, Curry's, Link. I might take a trip
tomorrow :-)

It will be a bit of a bother unscrambling the 'script' files which are
on the CD to find the phone number and a sample login sequence but
I'm sure it's possible.

I wonder how you register your e-mail address and password. Maybe
there's some e-mail registration template on the CD.

Anyone else out there playing with this? - you may have the answers
which will save us having to go and pick up the CDs.

From: rgc@zetnet.co.uk
Message-ID: <6uorfo$i2r$2@irk.zetnet.co.uk>
Source record: 92902

Can anyone tell me who actually owns the Atari version of GFA Basic?
Is it still supported for the PC?

I have heard that a new version of GFA Atari was nearly completed. If this is true then would it not be a good idea to produce a stable bug-free version of this language for the new TOS clones so that programmers of all levels can produce for them. My limited introduction to C was a nightmare and I dont know of any other up-to-date development packages there will be for the new machines.

->Then why use a 68030 in the first place? What's the difference between the
->Falcon 68030 and the Amiga 1200's 68EC030?

Let me clarify one thing right now. The Amiga A1200 did NOT come standard
with a Motorola 68030 CPU. It was a 68020...Yet another advantage the F030
had over the A1200 at launch.

->Do you mean the actual processor or the hardware around it? From what I
->understand, you could theoretically place a genuine 030 into a Falcon
->without any problems, but it's the bus interface between the CPU and the
->rest of the system that's 16-bit on a Falcon. Sort of like a 386SX PC (in
->which case the processor really had that limitation of 16-bit bus to
->external hardware, unlike a 486 that's hooked up to a 16-bit bus...)
->
->This is very confusing for me. If you'd care to clarify, please do! :-)

I think thats right, not that the 68030 was different.

>Is the F030 a 32, or 16 bit computer. Or did Atari corp pull the wool
>over our eyes like they did with the Jaguar.

I would say the Falcon is a 32bit, but I could be wrong.

My knowledge of the Jag is limited but as far as I am concerned the
databuses were 64bit. The two main CPUs (either of which could
control the whole thing) were 64bit. The 68000 was, of course 16bit,
but could access 64bit in multiple goes as it were.
So the Jag was 64bit. Those that say it was only 16bit are just
seeing the 68000 and assuming it is the main CPU. As to why it was
only about as powerful as 486DX2-66 with local bus graphics...

>Didn't the Amiga 1200 use an ec020 at 12mhz

Yep. Or was it nearer to 14MHz. The 7.16MHz of the A500's 68000
doubled up.

The Falcon's 030 is the full version with MMU built in. The EC020 and
EC030 don't have MMUs.

Rich.

If memory serves me correctly, the Atari version of GFA is no longer being developed. The last version was 3.6(tt030 version). The PC, check www.gfa.net about info on the Windows version,
I know they have a Windows demo available. I also think the site has info on the Atari version, but I not really sure about that.

I'll bet you saved the config with MCMD running didn't you? If you save the config while any TOS programs are running, VT52 will start them up again when it is re-loaded. To get rid of this problem, start VT52, close any windows that it opens and then save the config. This will/should stop VT52 starting MCMD.

>If I keep VT52 loaded then any TOS programs will run in windows.
>If I quit from VT52 then the original problem will recur. Is this
>a problem with MagiC or is there a way of getting the first TOS
>program to run in a widow rather than in full screen mode ?

I'm not sure if this will help, so there's no guarentees with it. Click on the TOS program you're having problems with and then select the menu option 'Install Application' (under Options). This will open up a dialog and you want to check that the box next to 'Modus' isn't checked. If it is, click on it to de-select it and press return/click 'Install' to close this dialog and press return/click 'Install' to close the one under it.

This will stop the program being single-tasked, if that is the problem. However, it could be another problem, similar to the one I keep having. I my case, if I stop VT52 from quitting when a TOS program has finished, and then I start another program up, VT52 will sometimes throw a couple of bombs and quit. The result of this is the program that was just loaded will end up looking as though it's being single-tasked even though it isn't.

There are some recent news and a link about GFA basic on the Milan
webpage.

http://www.milan-computer.de/html_d/index2.html

(note: the site is in german)

This is not a new version, but new libraries being developed in
assembler by Richard Gordon Faika. It's free of the incompatibilities with
modern TOS, modern cpu codes (68040, 68060), cookie FPU detection, and
some other goodies.

Regards.

Daniel.

Robert Guy Casey (rgc@zetnet.co.uk) wrote:

As far as I know, the STe does not check parity, so you can use any 8-bit or 9-bit 30-pin SIMM from a PC, Mac, ST, UNIX box or Amiga. You may want to find out for sure, but I think you can use any of it as long as it's at least 80ns. Can anyone out there verify this?

Thanks!
Louis

Well, now that I totally confused everyone with this question let me
clarify:

I'm looking for an APP(s) to assign to the desktop printer icon.
IdeaList is mentioned in the Thing docs. It seems like it's more than I
need but I tried it anyway. The problem is, when printing in Batch mode
using NVDI it just hangs... It works okay when not in Batch mode so I
have no idea what the problem is.

Is there one of the programs in the standard MagiC package which will
dump to the printer (with the proper command line parameters if need
be)? Can IdeaList be made to work in Batch mode?

Hmm, I don't recall this being disabled in the non-registered version
but is *that* the problem? The check (well, draft) really *is* in the
mail.

Thanks,

Pat

The 68020 and 68030 have a feature known as "dynamic bus sizing" which
allows the processor to detect if it is sitting on an 8, 16 or 32 bit bus
on each bus cycle, and react accordingly.

> Didn't the Amiga 1200 use an ec020 at 12mhz

An EC processor is essentially an embedded controller version of a
standard CPU, with a reduced bus size (16 bits instead of 32) similar to
Intels 386 SX (32 internally, 16 externally)

It has only happened to me since changing over to NEWSIE 92 John and
it happens every time.

>If it has happened since 0.86 or so, maybe it is an unusual problem,
>but that makes it even harder to catch.

>Question: Is closing the Mailbox window the last thing you do? I
>need to know the specifics to know where to look.

I use a similar method as Steve (above) uses except I use STIK
and not STING.I close my mailbox thus clearing the screen except
for the menu line,go to the drop down menu`s but they wont drop.
Nothing else works either,the only solution is a reboot.

It only happens with the Mailbox window. If I leave the window
open and use the drop down menu (which works if the window is
open) to Quit,the Mailbox window closes BUT the menu line remains
and NEWSIE does not Quit. Again forcing a reboot.

Message-ID: <6un9mf$crh@nnrp2.farm.idt.net>
Source record: 93012

Thanks everyone!

Actually I had the SCSI ID's set just fine.
I have no clue if the Maxtor is terminated internally, I have no documentation on it. It might be.

I actually got it to work with the LINK2 connected to the EZ 135 and then to the Maxtor, I was able to format and partition a cartridge. (I was booting from a Floppy with my ICD Hard Disk Driver.)
BUT. . .As soon as I rebooted, I got screens of garbled stuff during the Hard Disk Driver boot up screen, then a nicely frozen computer.?!
I then re-booted without a floppy and using just the ICD Boot from the Maxtor Auto folder, doing this
gives me (3) "Bomb" icons after it sees both drives and their partitions, and locks up.
Repeated tries do the same thing.. .Hmmmmm

It sho' is fun troubleshooting when I only have half-a-clue as to what I'm doing here ;-)
I'll keep jackin' with it.
Jeff

6875. 1stGuide as file viewer for Thing

Newsgroup: comp.sys.atari.st
Date: 1998-09-28 00:00:00 UTC
From: derryck@TAKETHISOUTcix.co.uk
Message-ID: <6unbqjqeq4@plutonium.compulink.co.uk>
Source record: 93013

I'm currently installing 1stGuide as a viewer for Thing but have run out of room on the filemask input line.

The obvious answer would be to add another line in thing.inf to extend the range, but each line is terminated by a series of ones and noughts, purpose unknown, so there could well be a problem with this approach!

Thing won't let me install a program twice so that approach is out, and I don't want to copy the utility with another extention.

Any ideas anyone please?

Try copying all the files over to another disk. If there are any errors,
then the disk has probably gone bad. It happens sometimes when you use
the same disk intensiveley over the years. Try using a backup copy. You
did make a backup disk, didn't you ?

The other thing I could think of is the dongle. Maybe it got
disconnected while under power or something ?

Cheers,
Nick

>still exist? IMHO it's still one of the best...

I think it's still there. But you're right, all those mags have simply
vanished. I recall when the ST came out in '85, lotsa mags emerged out of
the blue... and they vanished into the dark again.
Pity C't doesn't handle much on Atari these days.
We still got this ST magazine over here, you can't find it in the
bookshops any longer but it's still available by subscription. They do
everything on a TT, using Calamus. 6 issues a year for 40 guilders.
Together with the ACN magazine they're the last ones.

Werner,

actually I hooked up to a local support NG from my ISP last week and the
only thing I saw was a bunch of articles on the problems with MTU's, V90
modems etc etc etc. After 5 days I disconnected again, mainly because the
"contents" of the articles seemed to come from 12-year old kids broaching
"I can do 5000 cps here" "Nah, you can't" "Yes I can" "Nah you can't" etc.
They still don't gather that you can use ISDN superduper to your ISP, but
once you leave their servers to Mongolia you enter the traffic queue and
have to take whatever speed the lines allow for... No 800 MHz Pentium-VII
with 4-D accellerator boards and 1 Gb cache will make it run faster... but
let them spend their money... good for the economy :-)

Neotronica a ï¿½crit:
>
> I'm just now learning about the sequencing capabilities of Ataris and have some
> questions:
> 1) What are some good webpages for info regarding using Ataris solely for
> music/midi purposes?

I don't know of any Atari+Midi specific pages, though there probably are
some. Basically it depends on what program you'll be using. There's lots
of support for Cubase or Notator around.

> 2)When was the *last* atari with midi capabilities made?

All Ataris have MIDI ports. The latest ones are the Falcon and TT. The
clones don't have them as standard. The Falcon also has audio-sequencing
capability.

> 3)which atari system and software is the best for using as a midi
> sequencer/recorder?

Depends on how much you're willing to spend and you needs. Do you need
to combine audio and midi ? Then get a Falcon, with Cubase Audio and an
FAD or JAM digital audio interface. If you just want MIDI, get a plain
STE with a 2nd hand Cubase or Notator and you're set?

> 4)If anyone has any info they think would be helpful to a new guy send it!

Check out the Quick FAQ!!!

Cheers,

Still using STik ???? and the www131 package is REALLY outdated.

Get STiNG 1.15 and the latest CAB.OVL 1.3xxx. Links are in the Quick
FAQ. Follow the instructions.

If you don't have a HD, then a 1Mb machine will be slow anyway. And
forget about any pretty pictures. With that setup, it'll have to be
"graphics off".

Cheers,
Nick

Yes. The main Lattice C person has left the company. But we still do have
ppl w/ tech knowledge of the Atari and programming.

> There's not much point in buying products if they are not supported.

They are still supported. We just don't have the authors of some of the
programs anymore.

Yes. The CD will contain Netscape or Explorer so will only work on a
PC. I don't suppose we can expect Dixon's to supply Newsie and CAB :-)

However, that's no reason why we can't connect with an Atari provided
we can suss out the sort of details required on login. I'm certainly
going to give it a bash if/when they send me the kit.

>Hi Werner,
>
>well, this magazine has launched some crap at several times in the past

I agree on that. I remember that they copied / stole an article about sampling from a very old (now dead) Atari mag called Atari Magazine, without ever listing any credits whatsoever...
>
>I reckon about 2 years ago they did an article on this Microbox,
>suggesting Atari was still secretly working on it and launching it as
Yes that was bad - the suggestion part. Atari had clearly indicated that they entered the games market and left the computer market (well they did license tha Falcon to C-lab, to ensure at least some level of support :-) or simply to still get some money out of it :-)

>"Atari-Phoenix", complete with "secretly obtained photographs, which

Hmm I always thought they did not mean this literally. I thought that "Atari's Phoenix" meant something like "Atari's Salvation", and that all they could give for a name was the MicroBox thing.

So, how about that STE with built-in MS-DOS compatibility. Did they make that up or was it for real? (Someone know anything about it?).

You may find that your HD driver software includes a utility which will
scan your SCSI bus and report back the SCSI ID and model of any devices
it finds. ISTR ICD does, and HDDriver does. This will enable you to
check that your devices are in fact on different IDs.

I've got the same problem with CAB 1.5, 2 demo & 2.7 demo, Sting & MiNT-Net
The only CAB.OVL that works well is the one I found with CAB 1.5. All
others one do the same as described by Christophe.
I've tried all OVLs I could find and checked my DEFAULT.CFG but it still
doesn't work.
Newsie, Popgem, Popwath, ftp, atarirc, every thing works well

Vincent

I haven't delved into this part of the program much - contenting myself with
testing out the PDF support as that was my major concern.

I've just given the printer output a quick test, all seems to be well,
however I have to use a print spooler with this Nemesised Falcon
(GEMSpooler). TBH I doubt that this is your problem.

Have you tried passing your PS file as a command line to gs rather than
going via the GEM front end?

>It doesn't matter whether I try to change it with the options menu or the
>output menu.

No, shouldn't make any difference, and any of the HP drivers should work
with your printer. I assume that the other export drivers work OK?

If all else fails an email to Christian might be an idea.

Installing the board's not too difficult (assuming soldering skills), but
it's any tweaking that might be required to get the SCSI patch optimised
that might make you wish that you'd got someone else to fit it.

I installed Nemesis myself and I was lucky.

ITMT Titan has the Nemesis manual for downloading on their web site so you
can see for yourself.

Oh, and one more thing - Titan recommend the Panasonic 60nS SIMM if you're
upgrading the memory, it's shielded which helps overcome some problems with
noise on the display.

Personally I'd like both this and the graphics card adaptor but will
probably plump for the latter - I should see a slight increase in speed
(especially in higher colour depths).

I'm looking forward to the show in Stafford UK mid November - however my
credit card is already trembling... (g)

I studied and tested the SysEx specs of the JX10 to make a "device
adaptor" for the universal SysEx Editor/Librarian UNI_MAN.
(http://www.telebyte.nl/~mt/uni_man.htm).
The SysEx specs for the JX10 are VERY POOR however. The only thing you
can do is get/send the data from/to the M-64C cartridge as a bulk. You
cannot communicate via MIDI with the JX10 internal memory, nor with
individual patches. The module version MKS-70 has better SysEx specs.
The older JX-8P and even the JUNO-106 also have better SysEx specs.
The JX-10 is a great sounding synthesizer, but for guys who like to
play with SysEx it's not much fun.

Greetings;

I recall having a similar problem. Someone here told me to use the qfax
driver instead of fighting with the
stfax driver and voilla! No more cut sheet problem! Still works great.

I think I had to rename the file to match the stfax driver to edit the
target file. Otherwise, the cpx was
disabled on my system.

Hope this helps! Let me know.

Regards,

It would be nice if a few things could be improved. But I guess the userbase is
rather small right now. :-\

> > DevPac/MonST then? 040/060/GFX-card support in MonST would be nice for
> > boxes like Milan and Hades.
> >

> At the moment there are no plans to update DevPac on the Atari.

That's a pitty. As everyone knows that Lattice/DevPac is more or less dead
they will move over to other compilers/assemblers like GCC/GAS. If that
is bad or not is ofcourse a good question. :-)

What I miss is a nice integrated development enviroment. Lattice is not
perfect, but it's nice to use in this respect.

> > > But there are still Atari programs that might be updated.

Hello

I am trying to make a fadout on my audio file
with the lines off of CubaseAudio V 2.06
It does not work correctly
Steinberg does not answer
For example I want a fadout of 5sec,what have I to
write in the boxes:
- ofset samples
- offset time
- duration sample
- duration time
Duration time and sample display automaticly the
time of the song
Then the fadin/out window appears,what I have to
write in the boxes:
- fade time
- fade sample
Thank you for your help J. Rypko

Hello Jeff,
You can't use it on the Falcon (I've tried it too), but you can buy SoundPool's MO-4, which gives you 4 extra midi outputs from the printer port. It works great on my system...

Best regards,
Claes

Hello,

I am having problems connecting to my ISP (Telecom Internet - www.tinet.ie) using any port speed higher than 19200

My modem is a 33.6K fax modem from Genius. When I use a high speed, I find that Carrier Detect, is very slow in coming, or does not come at all, and also that even after carrier detect, the prompt does not always come from my ISP

Telecom Internet support speeds of up to 56K so I do not understand what is happening.

Can anyone shed light on this matter?

Thanks,

Jerry Martin

Just looking over the docs, it looks like it will work on the STE,
but it's not real stable for a lot of compressions. Might be worth a
try, though.

Here's the URL:

Message-ID: <361145908972b6e0@holleman.demon.nl>
Source record: 92852

Hi all,

I'm starting to get really interested in this Linux thing... so I hooked up to a few NG's but comp.sys.m68k seems to be the programmers group and comp.os.linux.m68k appears to have only Mac users (plus one Amiga guy).

Here's the main question: has anyone in here ever run Linux, especially on TT's or still does it?

Probably gonna add another HD to my set, 4.3 gigs and thus at least one 850 megs disk will be available for a Linux installation here. Maybe even 2. I've heard of this Whiteline CD with Linux stuff, but I think it's better to get in touch with other TT-users first.

So drop me a line please, either in here or thru' e-mail.

The former newsgroup is definitely a programmer's newsgroup but the latter
should have a few Atari Linux users on it.

>Here's the main question: has anyone in here ever run Linux, especially on
>TT's or still does it?

I ran Linux on a TT as an Internet server for about two years. It ran
great for the most part. I recently purchased an Intel box to run as
the server. But I'm still running Linux on my TT and plan on networking
the two boxes in the near future.

the tt had seperate memory. and my guess is so would a high-end falcon
version. the low-end was intended to be just that, low-end. but dual-purpose
memory does have its advantages in terms of cost-effectiveness. just take a
look at the slowly, but Intel-forced (and therefore forced upon most pc
users) AGP technology. reminds me of dual-purpose memory somehow... I think
that apart from the better busspec of AGP, a PCI card with dedicated memory
is still a lot faster than an AGP without dedicated memory, e.g. using
system memory...

Open up the Maxtor case (it's not difficult) and look for:
a) two or three roughly inch long by 1/8 in. wide rectangular objects in a row (drive is terminated -- those are the terminators)
or
b) sixteen to thirty little holes in a row (drive is not terminated -- that is where the terminators (resistor packs) go).

What do you think? :-) Demon - goes without saying...

>Yep - their dial-up number plus their DNS. BTW, someone posted all the
>details you require on comp.sys.amiga.misc
Got the details from another newsgroup - signed up a few minutes ago.

Don't like the way it automatically changed my IE4 settings, even
though IE4 was not running at the time - and now the title bar says
something about IE4 as supplied by Freeserve... sigh.

Am not keen on the idea too that you have to connect to freeserve via
their dial-up number to download your email form their pop3 server...
the whole point of pop3 is that you can download from anywhere...

Regards
Dan

I guess they should have more looked at the Mega STE. A 2nd level cache DOES
matter :-)

But at the time the TT bus was at 16MHz, PC's were still at 8...

6929. FS: SyQuest 88 MB SCSI removable hard disk system + carts REDUCED

Newsgroup: comp.sys.atari.st
Date: 1998-09-29 00:00:00 UTC
From: trevor@cyberspc.mb.ca
Message-ID: <N4cQ1.17$_Y.256386@typhoon.mbnet.mb.ca>
Source record: 92867
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other,misc.forsale.computers.mac-specific.misc

SyQuest 88 megabyte removable hard disk system with 6 (or 7) cartridges.
Drive is in perfect condition and all carts have NO bad sectors and are
in perfect condition too. Rarely used - only used for monthly backups.
This drive can also read 44 MB cartridges. This drive is SCSI.

Comes with 14 day guarentee to be free from defects.

Bare drive with 6 carts for only $229.

Bare drive with 1 cart for only $98.

Carts separately only $38/each.

Possibly available is an external case made just for this drive.
Most likely $20 _with_ purchase of the above drive.

6930. FS: Winnipeg Atari ST User Group fundraiser blowout! REDUCED EVEN MORE!

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of the STUG Chronicles (our newsletter) FREE!

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

CD-Recordable service - unrelated to STUG, it is my own company, but
worth mentioning here. STUG recently moved its nearly 1000 library
PD floppies to CD-ROM - never again worried with faulty floppies!

We can move your data or audio to compact discs and CD-ROMs! Over 800
Atari floppies per CD-ROM!

Pricing from 12$ to 55$ per disc depending on the data and how it is
delivered to me (ie hard drive or syquest is cheaper than floppies).
Email for more info.

Don't order from ICD! Tom Harker is a crook and a liar (one in the same?)
He'll take your money, promise to ship out the product and never will.
Whenever you ask for the product or a refund, he'll only spew more lies. ICD
CANNOT BE TRUSTED!!!! He has stolen money from several people. I have
complaints registered with the BBS and I even had the attorney general of
Illinois involved. Stay clear of ICD!

>

Warp 9 is a significant aid to screen drawing. However, NVDI is even better, and provides nicer printer access than SpeedoGDOS. I still use Warp 9 on my STe since I like the screen savers, but NVDI sure is nice on the Falcon.

As for the software only versions of BlowUp and Screenblaster -- I wouldn't bother with either. The Falcon has 25 and 32 Mhz clocks, neither of which are able to achieve 800x600x16 or 640x480x16bit unless you let the refresh drop below 60 Hz. (I would LOVE to be wrong on this). With the Nemesis and Videlity you get a 48 Mhz or 50 Mhz clock, both of which can achieve both the above resolutions quite nicely.

Well, I don't know if I'd capitalize 'much'. It is a bit faster, but I
switched to NVDI mostly for the printer capabilities.

I would love to hear about your Centurbo, particularly regarding compatablity and any opinions on hardware safety (I recall one 32 Mhz accelerator for the Falcon that tended to fry expensive Videl chips :-(Can't recall its name right now). Galen (Head YACcer, Yolo Atari Club)

Don`t care - don`t use MSIE unless I have to. BTW,. Tesco.net does a
similar thing.

> Am not keen on the idea too that you have to connect to freeserve via
> their dial-up number to download your email form their pop3 server...

Yep - I don`t like this either. Makes it difficult to access Email form
other locations. What was the idea of POP servers again. Oh yeah! So u
can access Email from different locations ;-)

> the whole point of pop3 is that you can download from anywhere...
>

Yep. I will try talking to their support team (by Email - I`m not paying
the 1 UKP per min) about this.

But the 5MB of free webspace w/ unlimited bandwidth isn`t bad. I will have
to test this. I will try not to break it like I did to some other server
this yr.

6945. FS: Upgraded 520STfm

Newsgroup: comp.sys.atari.st
Date: 1998-09-29 00:00:00 UTC
From: Bill Richard <wrichard@*mindspring.com>
Message-ID: <6us3p0$6ds$1@camel21.mindspring.com>
Source record: 92883

For Sale:

Atari 520STfm computer with internal DS/DD drive, stock mouse and QMI DeskCart plug-in clock/acc cartridge, upgraded to 1 Meg RAM (soldered onto motherboard, equivalent to a 1040STfm 'cept for the logo..) EXC working and cosmetic condition. Original box, TV adapter and manual.

$45 - buyer prepays sale price plus UPS from 70806 to destination (actual cost only, I can ship from work.)

Will sell within the US and prepaid ONLY - UPS costs may be material, and I don't wanna get burned on COD.. Have plenty of netrefs, and decent eBay feedback, though I'd prefer not to list these items there.

I'll throw in *several* boxes of disks (100+?) if you can use 'em - these may or may not be worth the extra few bucks for freight to you, depending on where you live and whether you have access to a bunch of ST prgs already.. Sorry, but I don't have time to go thru these.

Serious inquiries welcome. Thanks for looking,
Bill

>tried, SSL, authentication, cookies (for all CAB-versions)...

I agree with you. The MiNTnet-OVL is the best but one thing seems not to work for me and that is cookies. Sure I do get that message from Cab 2.7 asking me if I accept the cookie or not. So if I accept the cookie this should be writen to the harddisk in a file called "cookies.dat" right? That file is indeed on the HD but *empty*

With the latest STik-OVL the cookie is writen in that file alright.

Any idea about this?

Unfortunately, you are right. Computer Direct cheated on a LOT of
people and now, canadian Atari users are paying the price... :(

I suppose sueing Computer Direct would cost more, but in the long
run, dropping distribution rights means that the Atari market is
now dead in Canada, because the users have nowhere to buy anymore.

Being an Atari user in Canada means importing stuff from US or UK,
or even straight from Germany. It costs too much, so users have
to leave their Atari in the dust, when all dealers are gone... ;~(

AFAIK aFTP requires AES>=3.6 which means Falcon, TT(?) and, probably, the
clones using single-TOS. ST/STEs require some replacement AES, ie Magic,
Geneva or N.AES.

6957. Atari Software

Newsgroup: comp.sys.atari.st
Date: 1998-09-29 00:00:00 UTC
From: "A. F. C. St. Clair" <nermal@magicnet.net>
Message-ID: <3610179A.143@magicnet.net>
Source record: 92931

I have the following software for sale:

Software with original disks and documentation:

Antic Software:
Star Struck the astrologer (will load and work from a hard drive)
Maps and Legends the Cartographer (only runs on old TOS)
Data Map Collection 1
CyberPaint (Pro Animation Studio) from Antic Publishing, Inc.

CAD-3D (version 1.0) [all 3 resolutions]
Human Design Disk (Requires CAD-3D)
Genesis - The Stereo Molecular Modeler (StereoTek Option)
Future Design Disk (Requires CAD-3D)
Fonts, Primitives, Hints and Tips (Requires CAD-3D version 1.0 or 2.0)
3D Developers disk for CAD-3D 2.0
Architectural Design Disk by Darrel Anderson (Requires CAD-3D)

Flash STO220 by Joe Chiazzese and Alan Page (telecommunication package) [medium and high resolution]

The New Technology coloring book (low resolution only and only works with the old TOS)

GFA Artist by Michtron
First CADD by Generic software

WANDERER by Pyramid Software includes two (red/green) stereo glasses.
1st Word with manual (versions 1.01 and 1.02)

Fahrenheit 451 by Ray Bradbury (Telarium)

HabaWriter (reported to be the worst word processor ever for the ST!) It ran properly on my system!

Thunder! spelling checker (Batteries Included) for word processors without a spelling checker. Works better than the spelling checker in 1st Word plus

Oo-Topos for Atari 520ST by Polarware (missing the ships map)
The Crimson Crown (further adventures in Transylvania (Polarware)
Temple of Apshai Trilogy by Epyx
TASS TIMES in Tonetown (Activision
Hacker II the Doomsday Papers (Activision)
Mercenary (Datasoft)
Silicon Dreams (Firebird)
Jewels of /Darkness (Firebird)
Flight Simulator II (Sub Logic) only runs from disk
Revolver (Intersect Software) load two or more programs on a 4 meg system.

6961. Help w/ftp funet fi

Newsgroup: comp.sys.atari.st
Date: 1998-09-29 00:00:00 UTC
From: grovem@ridgecrest.ca
Message-ID: <6ups02$4uv$1@ash.ridgecrest.ca.us>
Source record: 92935

I'm a little confused about this ftp site. I find it one of the best
to get the latest and greatest, but it seems that I am accessing
different archives from home than from work.

From work, using Fetch (Mac), I can access the atari/incoming directory
and get for example the latest MiNT binaries. From home, using Newsie,
accessing the incoming archive displays nothing. It seems like from
home the current archive date isn't as current as from work either.
I'm trying ftp funet fi and also the web page.

Help

Thanks,
Mike

That's a hard one to answer...but I've seen GS working on a Falcon under plain TOS as well as on my own (a similar spec to yours but with MagiC 5.11). The only common denominator was that Peter (who translated the docs) was running a copy obtained from me - so it's possible that your download was corrupted somehow.

I had to change the extender from GTP to APP (PRG works just as well) as Magxdesk doesn't know about such things so that might be another avenue to try, don't worry too much about the gs.cfg for the while because GS should exit cleanly with an error message if it cannot find the overlay modules in the PS folder.

FWIW though my GhostScript folder is on drive H: in a folder GS11_TT which itself contains the PS folder so my cfg file says:

```
----[cut]----
# Configuration file for Atari ST Ghostscript.

I'd recommend STinG, but you should be OK with STiK - I don't think that aFTP works unless you're running MagiC or MinT so that's probably out.

You should certainly use HSModem as suggested, I think that for the MegaST you need drvin.prg and mfp.prg in your auto folder (in that order and near if not at the end), and then stiktsr.prg or sting.prg after those.

Isn't there a problem with TOS1.2 and hard drives?

Complete programming docs in English are available on my web site, address
below.

The version of WDialog in this archive is 2.0 but later versions have been
only the binary so I expect that the docs are still valid.

I suppose that it would depend on the particular S/N ratio for the
particular newsgroup, for the atari newsgroups I just download the lot.

Very much so Robert, does the centurbo have a SCSI patch?

Does the board plug into the expansion bus and is there a through connector?

The concensus is that you need a PC to set the service up but afterwards you
can access it with any computer.

I doubt that you'll get any support tho', and there's nothing to say that
you won't get spammed unmercifully afterwards.

And how much are 0845 calls?

Yes, Danny, but don't you think we have a decent chance of logging on
once we know the point-of-presence and the login sequence. I would
have thought that once we established a connection it would be fairly
irrelevant what browser/computer/mailer we were using.

The Falcon isn't more 32-bit than the STE. The 030 has 32-bit
registers (like all 68k processors), but it's most powerful feature -
the 32 bit dynamically sized bus - is unused.

The Amiga 1200 OTOH has 32 bit bus, which makes it atleast as fast as
the Falcon even with it's inferior (020) CPU and slower (14.28MHz)
bus. Separate fastmem and chipmem also helps a lot.

> Falcon 68030 and the Amiga 1200's 68EC030?

I guess they chose the 030 in order to be more compatible with the TT
(030-binaries). The Amiga 1200 has a 68020 (EC perhaps?), not a 030.
The difference is mainly in the MMU which is more powerful in the 030,
but the 030 is also a bit faster when executing some instructions
(don't ask me about details, it's been years since I argued with
1200-owners...).

> without any problems, but it's the bus interface between the CPU and the
> rest of the system that's 16-bit on a Falcon. Sort of like a 386SX PC (in

Correct. The 68030 (and the 020) has 32-bit, dynamically sized (which
means that it can talk to 16- and 8-bit devices as well) bus, while
only half of the bus is used in the Falcon :-(This cripples the
Falcon seriously, it would have been almost as fast as a TT with
32-bit bus. Graphics would have been faster, SCSI would have been
faster and more reliable...

Well, the setup requires you to change your IE4 defaults etc from what
I gather - and it says on the web site you need IE4 to sign up -
knowing MS tactics you probably do need IE4 as the signup probably
uses IE4 specific components.

Yep - if you are using MSIE it will change some settings automatically.

> - and it says on the web site you need IE4 to sign up -

Well... I used NSN ;-) Sorry don't have an Atari connected to the
Internet at home. AFAICT it should work w/ any browser that has SSL
support. You just need to know their server settings.

> knowing MS tactics you probably do need IE4 as the signup probably
> uses IE4 specific components.

Not AFAICT. I think the install just makes the normal changes - tittle
bar, homepage, etc. I will check w/ MSIE l8r to see.

Uwe is quite right here, but there is a problem of cables as well...

You'd need two hi-density 44p female connectors and the appropriate
hi-density cable. This will connect the 2,5" HDD to the Falcon.
Further on, you need an ordinary 40p female connector for the CD-player.
On the extending part of the cable, beyond the connector for the HDD,
you'd
need to disjoin the last four of the 44 leaders. The remaining 40 must
be
split and properly distributed among the "cutters" on the connector.
The scheme is 1-1...40-40.

Additionally, a power cable must be made to feed the CD-player with the
usual +5V, GND and +12V.

The cable would look something like this:

```
____________________ ______________/||
|| || ||
||____________________||_____________ ||
\||
```

F030 2.5" HDD CD

Be sure to plan in advance what length you'd need and where you'd want
your connectors placed! Normally the Internal HDD doesn't need more than
about 10-15cm away from the motherboard connector. The external
CD-player
would on the other hand need maybe 30-40cm away from the HDD.

I've made a couple of them and they function very well.

Another solution might be SCSI or an IDE-adapter on the cartridge port.
Someone told me these could be found in Poland, but that's all I know.
Maybe some polish reader could fill us in?

Regards, MG

When Atari first released the TT people complained about the
low compability to the older ST-machines, that's why the Falcon
is working with 16-bit. Even the memory-"bug" only to use 14Mb
is to be more compatible with ST.

Hello, I have decided to sell one of my Falc's.
It's an Atari Falcon Motherboard with all audio
and clock-patches. It has also FX-card with 10Mb
Fast-RAM and 4Mb ST-RAM mounted by dealer.

With FX-card you can run your falcon in 16,18,20,
32,36 or 40 Mhz. This one is stable in 40MHz and
you can run CAF in 806x744 in 16 colors.

Thanks, Alan, everything works fine up to here even though the best I
can get is a 14k4 connection.

>URL: https://signup.freeserve.net/

Right. I can get onto this through my normal ISP but when I try to
connect through the PPP connection I get with Freeserve there is a
DEAFENING silence! I just get stuck in 'Connecting to host....'.

I wonder whether I need the dotted.quad address of the local freeserve
DNS? Do you happen to know it?

>Mail server : pop.freeserve.net (incoming)
> smtp.freeserve.net (outgoing mail)
> (but .co.uk *will* work instead of .net apparently)

Mmmm STiNG will resolve these but there's not much point reconfiguring
my mailer until I can reserve myself a mail address. I guess I need to
make the signup.freeserve.net connection before I can do this.

Hello people..

Could somebody email me the specs or maybe even their impressions
of the software only versions of BlowUp and Screenblaster? B&C
carries both and I don't know which one to order.

Also, is Warp 9 really that much of a speedup to the screen drawing
routines of the ST/STE/TT/Faclon?

Thanks for your time.. :)

Bill

> is to be more compatible with ST.

The "memory-bug" is caused by the fact that the ST has lot of hardware
mapped to the range 14-16Mb. This is also true for the TT and Falcon.

As for the Falcon being more "compatible" than the TT... Well, I have
both and have generally fewer problems with games on the TT than the
Falcon. Even Super-Sprint works straight away in the TT...

> Well, and what about the 32 MHz clock of the TT?

Only the CPU works at 32MHz, the rest is still working at 16MHz. With
the pathetic caches in the 030 (256 bytes!) the clock-doubling doesn't
mean much, it's perhaps 10-15% faster than a pure 16MHz design.

BlowUp: Nice VMG, not so flexible at boot-time.
Screenblaster: Horrible VMG, flexible at boot-time. SB3 doesn't
work with MiNTOS...

I have used both of these, but ended up with Videlity from BSS. Good
VMG, clean and nice. Works fine with a large number of external
hardware like Screenblaster, Blowup, Speed Resolution Card, Nemesis
etc.

> Also, is Warp 9 really that much of a speedup to the screen drawing
> routines of the ST/STE/TT/Faclon?

Warp 9 == trouble. Stay away! Buy NVDI instead.

Thanks for beeing a lawyer of mine, Vincent!

But maybe I've got some good news for you. I managed to
access a few web-pages with CAB. One Problem was the setup
of the Proxy-server (I threw it away).
The other problem is, that CAB 1.5 does not fetch the INDEX.html
automatically, so you have to type it in the URL. And last of all
you have to delete the 0 byte files an the cache folder.

Unfortunately my CAB crashes after getting some links, but
this maybe a memory-problem of my old system. I'll try to use
new Newsie.

So long

Christoph

How can I access your famous Quickfaq.html without any web-browser :-)?
I would have done if possible. The only access I have is ftp and
unfortunately my archie does not list CAB_OVL younger than nov 1996.
My nearest ftp-severs (cs.tu-berlin and fu-berlin) contain
plenty of atari-stuff but not the latest CAB_OVL.

Give me a hint how to access your FAQ and I will humbly
read it :-)) and furthermore don't ask such NEWBIE-questions.

>If you don't have a HD, then a 1Mb machine will be slow anyway. And

>

I find it hard to believe. It was hard having a stable Amiga a few
years ago, I can imagine it must be even harder today, as I said, with all
the different third party hacks, needed to bring the Amiga (kinda) up to
date.

>> >No. The 14bit feature has always been there, and is very flexible.

>Only Amigasoundcards have Digitizers buildin.
>

That's utter bullshit. I still have an Amiga, so don't try to
bullshit me. You buy a digitizer, right, but even if you were dumb enough
to buy a 16 bit digitizer, you won't get any benefit from it, since the
Amiga sound is only 8 bit!

>> Do you get CD-quality sound in/out?
>
>CD quality ist 16 Bit/44100, Paula let you get 14 Bit/max. 56000 so the

>highcolormode (5/6/5) on a GFX-card, so that HAM8 looks on Pictures better
>than a highcolormode on a PC.
>

No they don't. The artifacts are there, they can be seen, thus it's
not better than a pure RGB image in 24/32 bit.

>> Don't try to spread bullshit here.
>
>I have the feeling, you like not to discutate, you like to start a
>flamewar. I know, that this group is a bad place to tell somthing goods

Mac users pay a little more, but not a whole lot, like Amiga users
do, and still get outdated technology (S3 gfx cards, etc)

>> AAA wouldn't be much. They should've implemented RTG, instead of
>> AGA, or at least by AAA's time.
>
>Yes, this would be nice. So you have an inofficial standard for RTG and an
>inofficial standard for RTS (retargable sound) to use.

Same for the PPC deal. As I said, the AmigaOS is, right now, a bunch
of "unnoficial" hacks. This has to be fixed, and hopefully will.

Thats 1 of only 2 advantages I can see that a stock A1200 has over a
stock Falcon... (the other is the solid pre-emptive multitasking OS)

Other than these, feature for feature, the Falcon walks all over the
A1200... ;-)

PS In some instances, separate Chip memory is a real pain, its very
slow, and can not be upgraded from 2 megs on the A1200. SO a very
big sound or graphic file can cause problems...

Hehe! There's an (slighty outdated) text version of the Quick FAQ on
Hallvard Tangeraas' FTP site at:

ftp://ftp.sol.no/users/h/hallvart/atari/info/quickfaq.txt

> >If you don't have a HD, then a 1Mb machine will be slow anyway. And

That should be enough to have at least small cache and allow you to
launch the Internet clients fast enough to avoid a timeout. The 1Mb of
memory will still force you to stay in text only mode though. No pretty
pictures for you ;-(

Cheers,
Nick

STinG & MiNTnet?? Are you using GlueSTiK + CAB.OVL for STiK/STiNG or
the dedicated CAB.OVL for MiNTnet when you're using MiNTnet? Of all
the OVL's I've used (for STiK/STiNG, PPP-Connect and MiNTnet) the
MiNTnet-OVL is by far the best. Very stable, works with all sites I've
tried, SSL, authentication, cookies (for all CAB-versions)...

The automatic fetching of index.html or default.htm is a function of the site itself (the server) not the browser, however I think CAB needs the final "/" if you're not specifying an actual page.

So typing a URL such as

http://www.sitename.com/

should be OK in CAB - it will just fetch the default page associated with that site.

Why don't you set 1stGuide as a viewer for all the files using [*.* or *]?

Assign another viewer to the files you don't want to view with
1stGuide.

For joysticks, yes, the pinout is identical, but the ST ports have no
support for analog input (paddles), which the Koala pad uses.

The ST ports support only digital inputs (for the mouse on the first
port, or joysticks on either port), but not analog inputs (POT/Paddle
inputs), which the Koala pad requires.

LM> I can recall seeing 1meg SVGA cards in Computer Shopper as long
LM> ago as 1989, perhaps even late 1988.
>
> At what cost?

$199, for the one I recall seeing the ad for. I expect the 1meg cards
from the "name brands" (Diamond, Hercules, etc.) that came out a bit
later were likely around $250-$299 at first.

LM> Owner of an A1200 with 18meg of RAM, 50Mhz 68030+68882, and a basic
LM> Atari Falcon030 with 4meg of RAM.

> Out of curiosity, how do they compare?

For one, the A1200 is easier to gets items for and expand. Example one:
To expand the memory on my Falcon, the least expensive new 72-pin SIMM
memory card is $69 (0K), and good luck finding one on the used market.
Finding a memory expansion for the A1200 on the used market is not
difficult, and I purchased my Microbotics 50Mhz 68030 accelerator for
less than I would pay for the mentioned 72-pin SIMM expansion card for
significantly less the Falcon memory card + a Nemesis (another nigh-to-
impossible to find used item).

On the basic hardware front, the Falcon has the A1200 beat up one side
and down the other on audio. An 8-bit 4-channel DMA play-only audio setup
just does not compare to an 8-channel 16-bit DMA audio system backed up
by a DSP, and with sampling capability built in. With the basic CPU, the
Falcon can have more memory (14 megs vs. 10 for an A1200), but with
accelerators for the A1200 easy to come by on the used market, I have
18megs on my A1200 now, and could expand it to 34megs or more simply by
replacing the 16meg SIMM.

Visually, both are similar. Without any tweaks, the Falcon tops out a
640x480 non-interlaced with 256 colors, or 640x400 interlaced or 320x480
non-interlaced in 16-bit color (65K colors). While the Amiga has higher
resolutions, they are either interlaced (I.e., 800x600) which I do not
tolerate well, or wide format (I.e, the 1280 pixel modes) which have
limited utility. On the plus, the Amiga has HAM8 at all resolutions,
while the Falcon has 16-bit modes. Both are close enough to 24-bit color
to be useful, but the Falcon's 16-bit mode is more straightforward to
work with. On the minus side is the limited res of that 16-bit mode. On
the plus side, unlike the Amiga, graphics can be substantially improved
without adding a graphics card (expensive with an A1200), by the use of a

bus accelerator such as the Nemesis, which as I recall, is around $80. With that, the 16-bit color mode (what Atari calls "truecolor", which is normally reserved for 24-bit color), can be used in 640 pixel wide modes on a VGA monitor, and other modes are available at higher resolutions (1024x768 or perhaps better). Even without that hardware, but just a program, my Falcon can achieve 800x600 non-interlaced, or 640x480 at 78Hz refresh.

In summation, the Falcon wins points for sound and video expandability, while the A1200 is tops in expandability of most any other kind, availability of both new and used goods, and overall support (number of newsgroups, size/number of web/FTP sites [nothing like Aminet for most any computer, and certainly not the Falcon], and of course, a parent company that is still around.

> Falcons are rare here, in fact I've never actually seen one.
> Sounds like a nice piece of hardware (from what I've read),
> but the OS is a letdown.
> True?

It's not multitasking, but I still prefer it in some ways. My Falcon certainly boots a lot faster than my A1200. <grin>

I have Geneva, which is supposed to be very nice and support multitasking, but I have yet to load it onto my Falcon, primarily as I am waiting until I get a memory expansion). The is also the Magic OS, which is TOS-compatible, but much more advanced, and a whole 'nother ballgame.

> that's not true. YOu don't get a lot at all. Try to find a good FTP
> program for free for example?

I have not really had to look. I have WS-FTP, which came with one of my
ISP discs, which makes no mention of a shareware fee. I do know there are
other freeware FTP programs, but as I have had no incentive to check them
out, I cannot attest to their worthiness.

> Or even a good terminal, or even winsocks is not free.

Hyperterminal Private Edition 4.0; downloadable from Hilgraeve's own site
or ZDnet. The Winsock for Win95/98 is part of the OS.

> They all are either part of wind95/98 package
> (which ain't free), or are shareware.

It is rather difficult to run software without having the OS in the first
place, however. As I recall, we were talking about Win95/98 software for
the internet here, but if you want to broaden it to other PC-box
operating systems, many of the free programs have Win3.1 versions as
well, and of course, Linux comes off rather well. The ST might fair
better in quality and volume of free internet software than OS/2, but as
I for one would not bet my life on it.

I would take "line speed" to mean modem-to-modem speed. 31.2Kbps is, I
believe, a legitimate "fall back" speed for 33.6Kbps modems. (A speed I
would be happy to achieve, as mine has never seen more than 26.4Kbps, and
then only once in a blue moon).

Megahaus (http://www.megahaus.com) is one place that sells these, but be
aware they are higher priced than the modern Syquest media, regardless of
the source. (Megahaus' price is $64 each). Unless you need to exchange
carts with other owners of 5.25" SyQuest drives, you could quickly find
yourself spending more money than a new drive would cost. With the EZ-
Flyer 230 available for as low as $79 (from MicroWarehouse), you could
almost buy an complete external SCSI EZ-Flyer for the cost of the first
disk for that old 200.

MGrove (grovem@ridgecrest.ca) wrote:

: Over two years ago I sold you a new Falcon motherboard from C-LAB,
: imported by Toad, for the sum of $500.00 (a sum which you
: were eager to pay).

Correct.

: I had tested the board for several hours and could not find
: fault with it. The package was shipped to you, insured.

Correct.

: About one week after arrival, you said that there were problems
: after you installed an FPU. My first thought was to check the
: buffer modification. You put this off for a year. Then approxmately
: six months ago, you requested I take a look at the board, two years
: after it was sold to you. I agreeded to checkout the buffer mod. I
: also advised that you really should send the board to ATY Computer,
: or Wizztronics to be checked out. An inexperienced person can really
: screw up a machine, especially a Falcon, in two years, and I didn't
: know what you had done to the machine in that time.

I had done nothing with the machine aside from using it for non-FPU
related functions. I made no hardware modifications.

: Yet I agreed. I couldn't see what the problem could have been as
: when I tested it, I installed an FPU and ran Scape882, the planet
: scene generator without problem and also ran an FPU bench mark app.

Almost correct, you actually worked with the machine for a while,
determining that there was a problem. In your testing, you left the
machine in a state where you indicated it would no longer boot. You opted
to send the machine off for repair, a most honorable gesture.

: Failing to find the problem, I agreed to send the machine to Wizztronics
: for repair. You were in a big damn hurry then as you were wanting to
: purchase an Afterburner and needed the machine. Including the time
: I spent looking over the machine, the $65.00 shipping fee to Wizztronics,
: or their $300.00 repair bill, I have lost all the money I had paid to
: Toad to in the first place. You agreed to split the Wizztroincs bill,
: for either $150.00, or a Falcon NOVA adapter you were suppose to ship
: over three months ago.

I offered to re-imburse you or send my second Nova Adapter and Mach64 card
which you accepted. This was not agreed prior to sending the machine to
Wizztronics. I did, however, want to share the burden.

: FYI, the only problem with the Falcon was a the chip select line for
: the FPU was bad. This could have happened when the board was shipped
: to you in the first place, when you installed it into your Falcon Rack
: case, or when you installed the FPU. Wizztronics did replace the FPU
: socket, so the damage could have occured at that point when you
: installed the FPU chip.

FYI, Wizztronics replaced the CPU, FPU socket, an made additional board level repairs on lines that were damaged. They seemed to believe there was much more wrong with the machine than something that I could have done while a techician seated an FPU.

: Now all of the sudden, you disapear from the Atari newsgroups, and do
: not reply to your mail. You did say about two months ago you had the
: adapter and only needed to get to the post office. Where the hell is
: the post office in Hawaii? Inside a damn volcano? I do have your home
: number, I could easily get your work number. You will start getting
: calls at work if I don't get payment or the Adapter very soon.

I'm not certain how you have deduced that I have disappeared from the Newsgroups, as I read them every day. You have my telephone numbers and e-mail address, so I'm not exactly sure why I haven't heard from you prior to this open message to Usenet. I understand that I was supposed to send the Nova Adapter to you a while back, but to be completely honest - I forgot.

I moved my studio and much of my computer hardware ended up in storage that I don't have easy access to. I also haven't yet received my Falcon back from Titan, so I actually haven't been spending time doing anything with my Atari computers for some time.

In short, it was out of sight, and out of mind.

For that I sincerely apologize.

: Now, lets take this a little further. Your friend Chris bought a TT
: from me with a 19 Moniterm moniter and an Axit TT Ram card for the sum
: of $400.00. Considering the cost of the ram card, he got a good deal.
: Before the sale, you said that he wanted the machine to run Norator on.

The computer was intended for use with _Emagic Logic_. C-Lab Notator is known not to function with 030 machines. I use Logic on my TT, and after seeing this, my friend decided that he wanted to sequence with a similar system. That is how we made arrangements to purchase yours.

: I told you I don't know anything about that application, but I had
: used the TT for a couple of years without problem, using many external
: devices such as an ICD Link, ScanX and an MicroTek scanner, Chronos 3D
: and dongle and VideoMaster ST.

I understand.

: You assured me as Norator ran on your TT that it wouldn't be a problem.
: Fine, deal done, package shipped to Chris. The next thing I know is
: you are on the phone saying the application and dongle only works for

: a short time, then the machine crashes. You actually have the machine
: torn apart trying to find the problem. You don't even have schematics,
: so what the hell did you think you would find.

Actually, I do have schematics in the TT service manual. When I called you, I didn't have them in front of me - they were with my technician. I called you for guidance because I know that you have an intimate familiarity with Ataris.

Logic would not run correctly on the TT that you sold to Chris.

: After a couple of weeks
: of phone calls and emails, you tell me that you and Chris are "Very depressed"
: that there is a problem with this TT. That is even after Alex at ATY told
: you that the TT and Norator have problems and are not considerd compatible.

It is correct that the TT and Notator are not compatible, but I do use _Logic_ on my TT regularly without incident. Alex at ATY also told me several other things that I do not experience with my TT - should I believe what is in front of me, or someone that is telling me otherwise?

: Wizztronics was a little more consertive and said that maybe one in ten
: TT's would work properly, a lot depending on the version of motherboard
: you have. Of course, you know more than them, and dicked around inside
: the TT further with only a phone call to me as guidence. Real technical
: approach there.

Actually, I took the recommendations from yourself, Wizztronics, and ATY - went over to my techician's shop, while he spent many hours with the TT service manual attempting to diagnose the machine. My TT, by the way, was purchased from this technician and works flawlessly. This fellow has performed successful board level repairs on my previous Atari computers, including a 1040ST, Stacy, Portfolio, Falcon, and TT. I had every reason to believe that he could solve our problem.

: You actually had the balls to ask Wizztronics to send
: you ten motherboards to check out, and send the rest back after testing.
: This came out of Wizztrtronics mouth directly.

Wizztronics indicated that they were currently too busy to test boards for me, but that they would be willing to do so when the Lynx TV adapter was complete. I spoke with Steve, and asked if he would be willing to ship three or four boards to me while retaining my credit card number. I indicated that would test the boards for Logic compatibility, mark them, and then return all but one which I would pay for.

Why is it that I have "balls" when I am merely attempting to facilitate a business transaction, and provide information that may be useful to the vendor should similar customers approach him in the future?

My only concern was to purchase a Logic compatible TT motherboard - I would eat the shipping, Wizztronics would sell a TT board without any time investment, and everyboady would be happy.

: The one and only mail I got from Chris said that "John said you helped him
: out and I was wondering if you could help me out as the TT is usless for
: what I need. It is currently in stroage."
: I'll bet it's in storage. Do you even know what was fried after you got
: through screwing with it?

The TT that you sold to Chris functions exactly as it did when you sent it to him. In fact, we performed several repairs to correct the work that _you_ had done when you were experimenting with the TT. Some of this included replacing the 6850 chips next to the cartridge port, as you had cut and patched two pins on each. We also replaced the crystal onto the motherboard, as you had replaced it with a socket which the crystal did not seat firmly into.

These were issues suggested by either ATY, Wizztronics, or yourself as possible causes for the Logic timing malfunctions.

I'm not sure why you assume that we fried anything - in fact, it was suggested to me by several technicians that you may have fried something when you were attempting to overclock the TT previous to selling it to Chris.

: I replied to Chris's email. I stated that I would purchase the TT back, he
: pays return shipping. I also wanted the hardware first, and time to check
: everything out before returning payment. I couldn't hold this offer long,
: so I set an experiation date on the offer. The date came an went. A few days
: later you mailed me and wanted to know if I had gotten hold of Chris. I told
: you I mailed him. He said that both or your mail servers are screwed up
: and I should remail the offer. Funny, two seperate ISPs with the same
: problem at the same time in the same state? Boggles the mind....

Chris and I use the same ISP - hawaii.edu - I'm not sure what you're speaking of here. I assumed that since we had not gotten any mail from you that our ISP must have been malfunctioning.

1) Neither of us received the message that you speak of.
2) I informed you that Chris was still awaiting your message, and asked that you re-send it. Still, neither of us received any such offer.
3) It is possible that you have an incorrect e-mail address for Chris, or that there has been some ISP malfunction. I refuse to believe that you lied about having sent these messages.

: Rant mode on: People get pissed off or suspicious when someone selling an
: item here wants a guarnteed form of payment in advance before shipping.
: It's assholes like you that cause this. The list of dubious people in the
: Atari community is small, but you just made the list. Congrats!

Mike, it's really not necessary for you to behave this way, especially in a public area. If you have these feelings and concerns with me, you should call me or e-mail me.

For your information, the TT and monitor that you sold to Chris is in storage, and he's using my Mega STE for sequencing. He's pissed at me for trusting my recommendation to purchase from you. That computer was

purchased for Logic, and does not function for that. I know that this is not your responsibility, but I suggested that Chris discuss the issue with you in case there was something that could be worked out.

Also, the Falcon motherboard that you sold me and was repaired by Wizztronics failed a short time afterwards. It is completely dead. For a total of $900, we have two computers that are collecting dust, and they were purchased from you. We've also been trying to communicate with you about this, but have not gotten responses.

Can we assume that there has been miscommunication and unfortunate circumstances surrounding these issues, and get beyond this?

: I expect my cash or hardware soon.

I'll send you your hardware Mike.

Next time, however, a call or e-mail would suffice.

John Perez

I've been doing some experimenting today. I can get PPP connection to the freeserve site (although only at 14k4) but can get no further. I guess that the installation kit has some 'magics' in it which, together with Internet Explorer, allow the initial signup via https://signup.freeserve.net/. I cannot get to the signup page with CAB v2.7.

Until you have signed up and got a personal password I don't think you can access any other I-net modes. I have tried FTP and http with no success.

I wonder whether the signup process is re-entrant so that some kind soul with a PC could do a signup for any of us who wanted to use it? I think that once a signup has been completed and you have a mail address and password it should be plain-sailing from there on with Atari I-net kit.

Yes (see previous) I have sort of convinced myself of this now. We
need someone with a PC to offer a 'signup bureau' :-)

The URL indicates that SSL is required for signup. So for using CAB you
need to use the MiNTnet CAB.OVL as it is the only one supporting SSL.
Or use NN or IE.

Let me just be a naysayer and tell ya'all that back in the day I blew up
three lynxes at -two- different times using cigarette lighters. Both
times, Atari was so kind as to replace them, since it was their adapter
that was faulty, but i don't think you can expect such service from ATari
anymore ;-). Be careful about those things - turn off the Lynxes after
the Car is started and turn them off before the car is parked, or there
may be "fooms!" in your future.

just a word of warning :-)

Dennis,
Actually you should plug the harddrive into the pass-through port on the printer controller, although I can't see why it wouldn't work the other way around.

If the printer controller has been modified to allow you to power down the printer it will have an external power supply or a cord plugging into a power source on the computer, such as the joystick port. The only other way to do it would be a battery and I'm not aware of anyone having done it that way. So, if there isn't a power cord going to an AC adapter or the joystick port I doubt whether it has the mod.

Jeffrey,
If you are using TOS 2.06 or higher, after the Atari logo appears (which is almost immediately) press and hold the Control key. This should allow the computer to boot from the hard drive but bypass the AUTO folder. I can't remember is this works on earlier versions of TOS, but I believe so.

Brilliant, thank you.

There could still be a few CAB 1.5 users still around who don't
necessarily have the benefit of the c.s.a.s.t ng. and might not know of
the CAB upgrades or are happy to stay with 1.5 anyway.

William Platt (NOSPAMwplatt@bellsouth.net) wrote:
: Is the F030 a 32, or 16 bit computer. Or did Atari corp pull the wool
: over our eyes like they did with the Jaguar.

I don't know about the Jaguar, but the Falcon is no more 32-bit than the ST is. Although the 030 can work on 32-bit numbers internally (just like all of the 68K family), the data bus, which is where the processor communicates with the outside world, in the Falcon is 16-bit.

: >Then why use a 68030 in the first place? What's the difference between the
: >Falcon 68030 and the Amiga 1200's 68EC030?

It was my understanding that the Amiga used some sort of 020. If an EC030 was used in the Falcon, there would have been no MMU. That's the only difference between the 030 and the EC030, I believe.

: >Do you mean the actual processor or the hardware around it? From what I
: >understand, you could theoretically place a genuine 030 into a Falcon
: >without any problems, but it's the bus interface between the CPU and the
: >rest of the system that's 16-bit on a Falcon.

In other words, there would be no benefit at all from putting in a normal 030, because the extra data bus bits would not even have anywhere to connect. It would be no different to the current 030 in the Falcon except you would have 16 more pins that don't go anywhere.

That is these video card owners term for constructing a display mode for their graphics card. Video Mode Generator. Videlity works much the same way.

Even without the Nemesis, standard video modes on the Falcon can be
slightly improved by adding an external clock. I just installed a
38Mhz external clock on a standard Falcon. I am now using 800*600 with
a 60Hz vertical/38.5Hz horizontal rate. It is stable.
I am using Videlity, but the shareware package should be able
to configure the same modes. This is 16 color. 256 color was a bit
shakey. TC mode can be very slightly improved. No slow down as far as
I can tell. 1024*768 16 color is possible, but not quite as pretty.
Check Jo's site for the info on how to do this. All you need is an
oscillator and a bit of wire. Very simple.

>partiton. No other partition gets errors.

I also get the occasional lost clusters and lost e-mail (e-mail titles are there, and the files are still on the HD, but NEWSie doesn't see them), or mixed up e-mail (e-mail titles don't correspond with their appropriate e-mail).

This has happened with NEWSie version .88 mostly (as that's the one I've been using up until a few days ago when I switched to .92; and these problems may very well be fixed with this version).

And a few times some STinG (.STX) files become corrupted - although depsite what others have experienced and/or documented here, I have no proof that NEWSie caused it.

Otherwise, it's a great little application and I thank John Rowjewski for all his hard work and continuing support!

I used the install application option of MagxDesk (with MagiC 5.11) and it
didn't work. I tried several different settings allowing various amounts of
RAM for PageStream, but no matter how I set it, it still took up all available
memory on my 14meg Falcon.

A good question. With my MagiC version (5.13 or something) I could not get it to do any difference. You should put it in one of your directories, probably the same as there you put different device drivers like SPIN and the RAMDISK thingy.

If I ever got 6.x I will see if I can get it to work, but so far no version 6 has arrived. :-((((

That was to be my next question, ATM I've got IdeaList plugged in but it's a wee bit OTT for a quick text printout.

1stGuide is a contender for printing graphics files via a GDOS system but thaty doesn't (appear) to extend to text files, however I'm sure that there is more in that utility than appears at first sight.

You might also take a look at PRINT.TTP from the MagiC distribution.

I think that you will be pleased with Thing! BTW, properly installed you can do neat tricks like dragging a file from a directory window into an Everest window and have the full pathname appear at the cursor position.

All in all I've spent a small fortune on registering software this month!

Hi Trevor,

now, start thinking please: How the hell do you think an Internet
Accelerator will speed up things OUTSIDE the ISP servers (and I don't mean
the route to your clients!) Did they install a new World Wide
Communications Network Facilities for Internet use too? Lemme guess: the
packets receive an extra ID, so whilst on route to Mongolia they flash
their lites, hoot their horns and all the other packets move aside to give
way, huh?
Suits me fine, buy your Accelerator Board for USD 500,- but don't complain
when you try to fetch a 3 Mb file from ftp://fastsite.mongolia.china and
it only comes in at an average 231 bps...

Hello,

I've made a few HTML pages about Calamus SL, with a few hints (for
typing maths) and some frequent errors in Calamus, and the way to avoid them
if possible.

You can read this pages at :

http://www.eleves.ens.fr:8080/home/curis/Calamus/sommaire.html

They are, for the moment, in French, and I have no time to translate
them in any other language for the moment.
If someone is interested by doing the translation, I'll be very happy
that s/he does it.

If you know other hints or errors (and way to avoid them), send me a
mail and I'll add them.

The current archive date?

> I'm trying ftp funet fi and also the web page.

The web pages at http://www.nic.funet.fi/ is only for testing and it
might have some problems. So if you have used that them don't.

There are MiNT kernels at piwo's mirror (/pub/atari/piwo-mirror/Kernel)
and /pub/atari/mint/kernel/.

What computer are you using ? An unmodified ST cannot go beyond
19200bps, even with HSModem.

If it's a Falcon, you still need HSModem to get a reliable connection,
but make sure you're not running in truecolor or 256 colors, because
this slows down the machine.

Cheers,
Nick

Mind you, Intel seem to have a dual interest - they recently announced
an investment in Red Hat, who produce Linux variants.

7058. TT030 and Falcon Differences?

Newsgroup: comp.sys.atari.st
Date: 1998-09-30 00:00:00 UTC
From: root <netman@cyberramp.net>
Message-ID: <36122E19.7C3DB5B0@cyberramp.net>
Source record: 92820

Hello

I have been a long time ST user, but know little about any Atari computers above that line.

Which is better the TT030 or the Falcon?

Thanks for your help.....

7059. Re: TT030 and Falcon Differences?

>
> Which is better the TT030 or the Falcon?

They are different beasts. The TT030 was designed as a professional workstation, whereas the Falcon was designed as a replacement of the ST home-computer range.

The TT is a bigger number cruncher, but the Falcon has extra hardware that compensates.

Basically, the main differences are:

TT030

Case: Mega STE style desktopper case
68030/32MHz complete 32 bit data path
ST-Ram and TT-Ram memory (I can't remember details)
ST and TT specific screen resolutions
Internal SCSI support
Stereo DMA sound
68881 coprocessor standard (I think?)
TOS 3.06 (latest)
VME slot

Falcon030

Case: STF/STE style case.
68030/16MHz 16 bit data path
ST-Ram memory limited to 14Mb
ST and VGA screen resolutions
Internal IDE/External SCSI support
Stereo DMA sound + DSP sound matrix
68881 comprocessor optional
TOS 4.04 (latest) support for colour icons, etc...

I'm sure you'll get other answers to complete this!

Cheers,
Nick

Hasn't happened to me (I'm on a Falcon).

However it *does* lock up on me if I close the Sting connection before exiting Newsie. But that happened in previous versions too.

Magic v5 writes the currently active keytable into MAGIC.RAM when it
is installed (so that this is what you get whenever you load Magic).

I wonder whether v6 uses the .SWG only at install time?

Newsie locks on my Hades too and that without wdialog as I don't use it
at all. I noticed one thing however. Under my usual setup, N.AES/freeMiNT
1.15-beta-3/Thing 1.27/NVDI 5 Newsie doesn't hang. It only happens when I use it
under singleTOS.
I normally don't use Newsie but to solved a few problem a friend of mine
had with Newsie I tried v 0.92 a few times offline.
Guess what? 2 lost clusters (log files)

I've never understood what that wdialog was for, so I've never
used it! as I don't run magic. Looked like something from that
other platforms windozs!

I'll try that leaving the window open, but it did the very same
thing after reading and posting with the newsgroups too. So to
make sure things work right, mostly I'll stick with .88!

I imagine you could simply write a MP3 app for the Falcon and/or TT (on the Falcon possibly using the DSP). Would be nice. Why a cartridge? Why not use the vast range of available sound samplers, or in case of STE/TT/Falcon, DMA sound. Then you could restrict it to (free) software, like on PC's. Keeps it cheap.

What I think would be interesting though, would be direct to disk audio recording using MP3 _ENCODING_. Saves a lot of HD space, and although probably not usable for professional purposes, it would give a nice edge to cheap audio recording on your computer. Perhaps use it in stead of regular AVR / WAV / AIFF files in say, games or something.

To my knowledge, MP3 is the same as an audio layer-3 of MPEG-2 full motion video files. I gather that any player for those files would do, but I'm unsure.

7076. Joystick info

Very likely, this is wrong. The mere fact they are using IE on PCs indicates
they are using TCP/IP over PPP, so there should not be a real problem with
stacks like STinG.

7082. Atari ST books for sale - Abacus series & misc.

Newsgroup: comp.sys.atari.st
Date: 1998-09-30 00:00:00 UTC
From: bretelle@autonet.net
Message-ID: <36147e6f.513530036@news.provide.net>
Source record: 92891

Getting down to the last of the Atari ST items on my shelves.

These books are especially valuable sources of ST info. They haven't been available for many years, and when they're are gone, the information in them pretty much goes with them.

Priority Mail shipping is $3.00 for one or two, or they can be sent at Book Rate which is a little cheaper (and a lot slooower).

Misc. Atari ST Books - $10 each

Compute's ST Programmer's Guide -

The comprehensive guide to programming the Atari ST personal computer. Includes dozens of example programs, details on how to access advanced features and explanations of BASIC and LOGO. Includes writing GEM applications in "C".

Programmer's Guide to GEM - Sybex

A detailed introduction and reference guide for anyone wishing to develop applications for the GEM operating environment. Programming the VDI for portable graphics software, using the Resource Construction Set, a complete guide to AES functions and lots of programming examples in C.

GFA BASIC Book - MichTron

An intermediate programming tutorial for GFA BASIC, written by Frank Ostrowski, the author of GFA BASIC itself. It's designed for the person with a casual knowledge of BASIC who wants to gain an understanding of the more complicated aspects of the programmers' art. It guides you step by step through many intricate facets of BASIC and GEM programming, using GFA. Comes with a disk containing many of the program examples. This book is especially valuable for the practical insights Frank gives from his years of development on the ST.

ABACUS Software Atari ST books - $10 each

Volume 2 - Atari ST Internals -

The authoritative insider's guide. Chips, MIDI, GEMDOS, Sound, BIOS, Interrupts, Errors, almost everything you need to know about the ST.

Volume 3 - Atari ST GEM Programmer's Reference -

The complete guide to programming the ST using the Graphics Environment Manager. GEM, VDI, AES, GDOS, GIOS, programming, development, compiling C, inside GEM. Many example programs in C and

68000 assembly language.

Volume 4 - Atari ST Machine Language -

Complete introduction to machine/assembly language on the ST. Logical operations, bit manipulation, program development, 68000 register structures, memory structure, operating system, and more. Many examples and problems with answers.

Volume 5 - Atari ST Tricks & Tips -

Valuable collection of software tools and programming hints. Using GEM from BASIC, adding machine language to BASIC programs, super fast RAM disk, print spooler, starting TOS applications automatically and more. Contains program listings and color plates. A collection of info that didn't quite fit into the other volumes.

Volume 8 - Peeks and Pokes -

Keys to revealing the secrets hidden within your Atari ST. Using the BASIC "Peek" and "Poke" functions to: Customize the desktop, change the mouse shape, change the character set, read the keyboard or joystick, make your own fill patterns, direct disk accessing, system variables, pointers and the CPU stack, setting up the RS-232 interface and a lot more. This book packs a lot of valuable information all in one place.

Volume 9 - Atari ST BASIC Training Guide -

Everyone's introduction to ST BASIC. A functional, educational and well-written introduction to ST BASIC. From problem analysis to algorithms to BASIC commands. It helps teach programming quickly. Includes quizzes on the concepts introduced to reinforce the learning of programming.

Volume 11 - Atari ST BASIC to C -

Move quickly beyond the BASICS with the powerful C language. Use your knowledge of BASIC to move on to programming in C with the help of this useful guide. Shows comparisons between the familiar concepts of BASIC and the equivalents in C to make moving into this more powerful and versatile programming language very easy. Many, many programming examples.

Volume 12 - Atari ST 3D Graphics Programming -

Concepts and techniques. Learn how to create impressive and fascinating 3D graphics on the ST. Covers the basics, then moves on into more advanced concepts. 2D & 3D transformation, hidden lines and surfaces, data structures, spatial projection, screen manipulation, rotation, light and shadows, and more. Includes many programming examples in 68000 assembly language.

Volume 13 - ST Disk Drives: Inside and Out -

Discover the capabilities of the Atari ST disk drives. A book with in-depth coverage of the concepts and techniques of using floppy disks, hard disks and RAM drives. The book explains in detail the file structures, software, firmware and hardware that support disk functions on the ST. BIOS, DMA, controllers, tracks, sectors, clusters, gaps and FATs. Includes an extensive description and listing for a full-function disk monitor program to help investigate the ST's disks. Lots of info in this one.

I'd just as soon pack all of these into one big (and heavy) box, so make me an offer on all of them or bundles.

If you're planning on sticking with your ST, or are new to the world of the Atari ST, you need these books!

BobR

7083. Games, utilities for sale

Newsgroup: comp.sys.atari.st
Date: 1998-09-30 00:00:00 UTC

Getting down to the last of the Atari ST items on my shelves.

Priority Mail shipping at $3.00 per order for as many items as you want should cover it.

NOTE: All of these ran fine on my TOS 1.0 520ST with 2 Megs of RAM, and most ran on my STe, but with all the variations in TOS versions, I can't guarantee they'll run on any other specific version of TOS, so all sales are final!

STOS - The Game Creator - Create your own games using the included tools: sound and music editor, sprite editor, room designer, character set editor, icon editor, screen compactor, etc. Includes 3 completed games to play and examine, or modify as you like. Huge manual and programming reference card - $15

Shoot-Em-Up Construction Kit - Similar to the STOS package, but far simpler and requires less programming. Includes 3 completed games as examples of what you can create with the program. - $5

Stellar Crusade from SSI. Space Battle strategy game. Design and build ships, conquer the universe. - $5

Questron II from SSI Fantasy Adventure game. Monsters, dungeons, similar to the Ultima series. - $5

Gunship from Microprose. Excellent Apache Helicopter flight simulation. Battle Russian Tanks and helicopters in this very realistic helicopter simulator. Includes overlay for the ST keyboard to identify all the keys needed to fly this mean machine. - $5

Leather Goddesses of Phobos - Infocom text adventure game with a "twist". Three playing modes: Tame, Suggestive or Lewd. Includes 3D comic book and 3D glasses, map and exclusive "scratch and sniff" clues. - $5

Utilities Plus from MichTron - Includes many of MichTron's most useful utility programs. MichTron Utilities to directly edit disk contents, Super Directory, a powerful disk cataloging utility, M-Disk Plus, a RAMdisk and Print Spooler, DOS-Shell, an MS-DOS command line emulator and the VERY handy "STuff" package of 21 great utility programs including "GEMs" like KEYCOMBO which sets up "hot keys" for important functions, AUTOGEM which autoboots selected GEM programs, CAPSLOCK, VERIFY, AUTODATE, UNHIDE, and many more. Includes large manual to cover all the functions and features of this great package. - $10

Publisher ST from TimeWorks - Desktop Publishing for the ST. Comes in a deluxe slipcase cover, lets you do page layout design and publishing from your GEM desktop. - $15

7084. MTU's etc, prev. Re: Peter Rottengatter

I thought the same as you but I had an mail the other day from a friend
who'd seen adverts for a device known as an Internet Accelerator that is
supposed to speed up downloading by a factor of 12 amongst many other
wonderful things!

Anybody any idea what that's all about?

Trevor
